**Munsey, Frank Andrew** (1854-1925). American publisher. Born at Mercer, Minn., Aug. 21, 1854, he had some experience as a telegraphist in Augusta, Maine, and then went to New York, where in 1882 he founded *The Golden Argosy*, an 8-page weekly illustrated paper for boys and girls, later known as *The Argosy*. Munsey's Weekly, a periodical for adults started in 1889, became a monthly, *Munsey's Magazine*, in 1891. Owner of *The New York Sun* and *The Baltimore News*, *The All-Story Magazine*, *The Scrap Book*, and other publications, Munsey wrote *Afloat in a Great City*, 1887; *The Boy Broker*, 1888; *A Tragedy of Errors*, 1889; *Under Fire*, 1890; *Derringforth*, 1894. He died Dec. 22, 1925.

**Munster.** One of the four provinces of Eire. It consists of the six counties lying in the S.W. of the country, Clare, Kerry, Cork, Waterford, Tipperary, Limerick. Its area is 9,316½ sq. m., making it the largest province. A mountainous region, it contains some of the wildest and also the most beautiful scenery in Ireland. Munster was one of the old Irish kingdoms, and was at one time divided into Thomond, the N. part, and Desmond, the S. part. Its independent kings existed until the 12th century. In the reign of Elizabeth a president was appointed to govern Munster, which about this time was divided into counties. The name survives, although for purposes of administration those of the cos. and the co. bors. of Cork and Limerick apply. Pop. 923,930. See Eire; Ireland; Thomond.

Munster arms

**Munster.** Town of Alsace, France. In Haut-Rhin dept., it stands beneath the Vosges, where two small streams unite, 11 m. W.S.W. of Colmar. It has textile industries, and the buildings include a Romanesque church and a theatre. A Benedictine abbey, founded in the 7th century, was the nucleus of the town, which was made a free imperial city in the 13th century. In the 17th century it passed with Alsace to France; during 1871-1919 it was German. Through the fertile valley of

Munster the river Fecht flows. See Munster Cheese.

**Münster.** Former capital of Westphalia, Germany, now in North Rhine-Westphalia. Until

Münster, Westphalia. The 14th century Town Hall

virtually destroyed in the Second Great War, it was one of the most beautiful specimens of a medieval city, also a leading administrative and economic centre. About 78 m. N.N.E. of Cologne, on the Aa and the Dortmund-Ems canal, it was a rly. and shipping junction, centre of an agricultural area, and seat of a university (founded 1773) and an old bishopric of formerly princely rank. Buildings included the huge cathedral (1165-1265), the churches of S. Lambert (1450), Our Lady (1346), S. Ludgerus (1170), S. Servatius (13th cent.), and S. Martin (1370), the Gothic town hall (1313), scene of the treaty of Westphalia (*q.v.*), 1648, old guild halls, patrician houses of 16th to 18th century origin, and the bishop's palace. Engineering, iron, wire, cement, milling, brewing, and distilling industries flourished, as did the trade in Westphalian hams, sausages, pumpernickel, and hand-woven linen. There were scientific institutes, libraries, museums, academies, a theatre, zoological and botanic gardens, hospitals, etc. Pop. (pre-war) 143,748; (1949) 88,000.

Made a bishopric for the future Saint Ludgerus by Charlemagne in 802, Münster (Lat. *monasterium*) was originally a fortified monastery. It obtained civic rights as a Hanseatic town c. 1250. It saw the Anabaptist "Kingdom of Zion" of John of Leyden. Secularised in

1803, and united with Prussia, except for parts of the bishopric that fell to Hanover and Oldenburg, it became a bishopric again in 1821.

In the Second Great War, the German commander in Münster refused to surrender when requested to do so, April 3, 1945. The town was therefore heavily shelled, and when it fell to the British 2nd army was a blazing ruin. After the German surrender, Münster, in the British occupied zone, was a local h.q. of the control commission.

**Munster, EARL OF.** British title held since 1831 by the Fitzclarence family. The 1st earl was George (1794-1842), natural son of the duke of Clarence, afterwards William IV. His other titles were Viscount Fitzclarence and Baron Tewkesbury. Descendants succeeded until in 1928 the title came to Geoffrey (b. Feb. 17, 1906), 5th earl, who held under-secretaryships of state in the Coalition governments of 1939 and 1943-45.

**Münsterberg, HUGO** (1863-1916). German psychologist. Born June 1, 1863, at Danzig, he was educated there and at Leipzig and Heidelberg. In 1891 he became professor at Freiburg, but in 1892 he settled in America as professor of psychology and director of the psychological laboratory at Harvard. In 1911 he was made director of the American Institute in Berlin, where he died, Dec. 15, 1916. Münsterberg upheld the theory of voluntaristic idealism, according to which the will is the essential principle, as opposed to intellectualism, which regards the intellect as supreme and knowledge as derived from pure reason. A pioneer in industrial psychology, he published in 1914 *Principles of Psychology, and Psychology General and Applied*.

**Munster Cheese.** French cheese taking its name from a town in the Alsatian department of Haut-Rhin. Red-rinded and cylindrical, it is a fermented, whole-milk cheese, made from Nov. to April in the Vosges. Though it has a forbidding odour and is not attractive in appearance, it is popular.

**Munthe, AXEL MARTIN FREDRIK** (1857-1949). Swedish physician and writer. Born at Oskarshamn, Oct. 31, 1857, he attended Uppsala univ. and became a fashionable ladies' doctor in Paris and Rome, amassing a large fortune. He was appointed court physician to the king of Sweden, 1903, and to the queen, 1908. Retiring to Capri, where he built the villa of San Michele, he devoted himself to

writing, *Memories and Vagaries* appearing in 1908. His best-selling autobiography, *The Story of San Michele*, 1929, was trans. into many languages. By his own account he narrowly escaped death from cholera and earthquake, a duel and an avalanche; he was long almost blind and a sufferer from insomnia. In 1946 he presented San Michele to the Swedish archaeological institute in Rome and took up residence in the royal palace at Stockholm, where he died Feb. 11, 1949.

**Muntjac** (*Cervulus*). Species of small deer, found mostly in Indian jungles. The upper canine teeth in

Muntjac. Small Indian deer

the male project beyond the lips like tusks. The antlers grow from pedicles of bone forming prolongations of the frontal bone. The female has neither the tusk-like canines nor antlers.

**Muntz Metal.** Alloy of copper and zinc. It admits of being forged and is much used for sheathing, bolts and nuts, pump rods, and other parts of machinery which are to be exposed to the action of sea water or other influences calculated to corrode iron or steel. It was brought into use by G. F. Muntz of Birmingham in 1832. *See Alloy*; *Brass*.

**Münzer, THOMAS** (1490-1525). German sectarian and revolutionary. A native of Stolberg in the Harz, he joined the reformers, but in 1521 advocated extreme doctrines, and demanded obedience as an inspired prophet. He is sometimes considered the founder of the Anabaptists. Having planned the murder of his opponents at Zwickau, he fled to Prague, and then appeared at Wittenberg, where he found influential support until Luther arrived and restored order. Münzer retired to Allstedt in Thuringia and set up a communistic theocracy. Expelled in 1524, he took a leading part in the Thuringian peasant revolt. His camp at Frankenhäusen was taken by Philip of Hesse and John of Sax-

ony, May 15, 1525, and Münzer was beheaded at Mühlhausen, May 27. *See Anabaptists*; *Peasants' War*; *Reformation*.

**Mur.** River of Austria and Yugoslavia. It rises in the Eastern Alps in Salzburg, Austria, and flows through Styria past Graz, where its valley is a valuable line of communication on the routes to Vienna from the S. and S.W. Below Radkersburg it enters Yugoslavia and joins the Drave, of which it is the principal affluent.

**Murad I OR AMURATH I** (1319-89). Sultan of Turkey. Succeeding his father Orkhan in 1359, he conceived the ambition of establishing his empire in Europe, and, favoured by the disorders in the Balkan countries, began his advance. Capturing Adrianople and defeating the kings of Hungary, 1363, and Serbia, 1366, he established his realm as far as Sofia in 1382. The subjugated princes eventually formed an alliance under Lazar, tsar of Serbia, and marched against the Turks, but were defeated at Kossovo, 1389. Murad did not live to reap the fruits of his victory, being assassinated by a Serbian soon after the battle.

**Murad II** (c. 1403-51). Sultan of Turkey. Son of Mohammed I, he succeeded to the throne in 1421, but a series of unsuccessful wars with the Hungarians under Janos Hunyadi led to the treaty of Szegedin in 1444. By this Murad abandoned his sovereignty over Serbia. He twice abdicated in favour of his son, Mohammed, but each time was recalled to the throne by foreign menace. His campaigns against the Hungarians ended with the victory over Hunyadi at Kossovo, 1448. He died at Adrianople.

**Murad III** (1546-95). Sultan of Turkey. Succeeding his father, Selim II, in 1574, he showed indolence and sensuality that made his reign a continual struggle with the janissaries. The first English ambassador was accredited to the Porte in 1583.

**Murad IV** (1611-40). Sultan of Turkey, who ascended the throne in 1623. His minority was the opportunity for grave disorders throughout his realm, which culminated in an attack on the palace at Constantinople, 1631. Naturally of a stern and imperious character, Murad soon earned a reputation for unparalleled ferocity, putting to death during eight years at least 100,000 persons. After a successful campaign against the Persians in 1638-39, he died of gout due to habitual drunkenness.

**Murad V** (1840-1904). Sultan of Turkey. Born Sept. 21, 1840, the eldest son of Abdul Mejid, his whole life, with the exception of a brief interval, was spent as a prisoner, first of his uncle the usurper, Abdul Aziz, and then of his brother, Abdul Hamid II. In 1876 he was proclaimed sultan on the fall of Abdul Aziz, but after three months he was himself deposed in favour of his brother, whose prisoner he remained until his death, Aug. 29, 1904.

**Muraena.** Genus of large fish, resembling the eel. It occurs mainly in the tropic seas, though *M. helena*, one of the 80 odd species, is found in the Mediterranean. Some of the species are 10 ft. long, and their strong and sharp teeth make them dangerous to fishermen. Most of them are handsomely coloured and marked, and they have been esteemed as table fish since classic times.

**Mural Circle.** In astronomy, name given to an instrument formerly used for measuring the declinations of stars. It consisted of a graduated circle on firm foundations, and carrying a telescope which revolved in the meridian plane. It was superseded by the transit circle (*q.v.*).

**Mural Decoration.** Artistic adornment of wall surfaces with conventional or pictorial designs, either flat or in relief, or with materials decorative in themselves. While mural decoration is subsidiary to architecture, and takes different forms appropriate to the different styles of building, it consists in the application of many other arts, especially painting, sculpture, ceramic, and textile art.

Painting on a flat plaster surface is the most widely diffused method, and is applied, where the climate permits, to exterior as well as interior decoration. Tempera and fresco were generally used by the ancients. The Egyptians employed brilliant and somewhat crude colours. The Cretans decorated their palaces with delicate naturalistic frescoes from 2000 to 1400 B.C. In the classical age of Greece, colour was freely applied to walls, but our knowledge of ancient mural painting is mainly derived from derivative or late styles, Etruscan and Roman, especially the art of Pompeii. Gothic architecture, though providing relatively little flat wall surface, was accompanied by a revival of wall-painting, greatly developed at the Renaissance. Modern attempts at the revival of fresco painting have been sporadic, and not very fortunate.

The use of sculpture for mural

decoration dates from remote antiquity. The Egyptians covered their walls with painted bas-reliefs, often countersunk. The alabaster carvings in very low relief in Assyrian palaces are marvels of technique. In Greece reliefs were sparingly used, chiefly in friezes. Late Gothic employs diaper patterns, and the walls of Muslim buildings are often adorned with sculptured arabesques.

A frequent method in all ages from the Aegean civilization of Crete, through the classical, Mahomedan, and Renaissance styles, has been the application of stucco, gesso, or other kinds of plaster, to form designs in relief on a flat surface. It is often combined with painting and gilding. The Alhambra and other Moorish buildings owe much of their beauty to coloured stucco.

From the glazed brick of ancient Persia was ultimately derived the magnificent Oriental art of covering walls with moulded and enamelled tiles, in which geometrical designs, flower patterns, and Arabic texts are employed. In the Renaissance age, Italian faience and terra cotta were extensively used in mural decoration.

Woven hangings were used from early times, but tapestry is a characteristic art of the Renaissance. Rich effects were produced in the 16th and 17th centuries by stamped leather, silvered and covered with yellow varnish. Painted and printed cloth were cheap substitutes for tapestry. Oak panelling, often richly carved with foliage and fruit, was frequent in Tudor and Stuart England. Wallpaper gradually came into use in the 18th century, and was raised to a fine art by William Morris and others a century later. See Encaustic; Faience; Fresco; Gesso; Glaze; Mosaic; Painting; Panelling; Plaster; Rococo; Sculpture; Sgraffito; Stucco; Tapestry; Tempera; Terra Cotta; Tiles; Wallpaper; Wood-carving.

**Murano.** Island and town in the Venetian lagoon, Italy. It is  $1\frac{1}{2}$  m. N.E. of Venice, forming a suburb of that city. The island, 5 m. in circuit, once thickly populated and possessing its own mint, is now largely occupied by vineyards. It has a cathedral dating from about 970, since rebuilt and

restored, and other churches with valuable pictures. The museum is rich in examples of glass-work, for which Murano has been celebrated from the 13th century. Introduced by Byzantine glass-workers during the Crusades, the industry declined during the 18th century, but was revived in the 19th. Pop. 5,800.

**Murat, JOACHIM, KING OF NAPLES** (1767-1815). French soldier. Born March 25, 1767, at

*(Signature)*  
After Gérard

La Bastide, S. France, the son of an innkeeper, in 1787 he enlisted in a cavalry regiment, and obtained a commission in 1792. Three years later he attracted the attention of Napoleon, and accompanied him to Italy, where in recognition of his services he was made general. Accompanying Napoleon to Egypt, he distinguished himself at the battle of the Pyramids, 1798, and was given command of the cavalry in the Syrian campaign, being largely responsible for the victory of

Murano, Italy. Rio dei Vetrai, the principal canal of the Venetian island

Abukir. Returning to France, he was active in promoting the consulate, and in 1800 married Caroline Bonaparte, the consul's youngest sister. He crossed the Alps with Napoleon, fought at Marengo, was given command of the army of Italy, and drove the Neapolitans from the papal states. In 1803 he was made governor of Paris.

Upon the establishment of the empire, Murat was made prince, marshal, and grand admiral of France. The campaign of 1805 found him in command of the cavalry, and as a reward for a series of successes, culminating at Austerlitz, he was in 1806 made grand duke of Berg. Later in the year he took up his old command, and fought with distinction at Jena, Hohenlinden, Eylau, and Friedland. In 1808 he was sent to Spain as lieutenant-general of the emperor, but after two months, upon Joseph Bonaparte becoming king of Spain, Murat was made king of Naples, under the name of Joachim Napoleon. The position was intolerable and led to serious differences with the emperor. The war with Russia, however, brought Murat to Napoleon's side, and he was given command of the cavalry in the campaign of 1812. When Napoleon hastened back to Paris, he left Murat in command of the retreating army.

Murat's fears for his throne were increased after the Leipzig campaign, and he hurried to Naples and entered into negotiations with Austria. Allying himself to that empire, he attacked the French in N. Italy, but on Napoleon's escape from Elba, he offered his services to his old master, and declared war on Austria. His army was routed, and he fled to Naples, and thence to Cannes, where he organized an expedition against the Bourbons who had been reinstated in Naples. With 200 men he landed in Calabria, at Pizzo, was taken prisoner, tried on the spot by court martial, and on Oct. 13, 1815, was shot in the courtyard of the castle. Thoroughly unreliable as a subordinate, Murat ranks among the great cavalry leaders. *Consult* Life, A. H. Atteridge, 1911.

**Muratori, Lodovico Antonio** (1672-1750). Italian scholar. Born near Modena, Oct. 21, 1672, he became librarian at Milan, and in 1700 was appointed librarian and archivist to the duke of Modena. Nearly 50 volumes of Italian historical materials which he collected and edited are his imperishable monument; they include *Rerum Italicarum Scriptores*, 1723-51;

*Antiquitates Italicae Medii Aevi*, 1738-42; and *Annali d'Italia*, 1744-49, the second book of which contains the 2nd century canon of the N.T. books known as the Muratorian Fragment. The "father of Italian history" died at Modena, Jan. 23, 1750.

Murcia, Spain. Cathedral tower, completed in 1766, with, left, the 16th century Chapel of los Velez

**Murchison.** Geographical name in Western Australia. It is that of (1) A river which rises in the Carnarvon Range and flows S.W. to Gantheaume Bay. (2) A goldfield E. and S.E. of the Sanford, a left bank affluent of the Murchison. Cue, its capital, is connected by rly. with Geraldton. (3) A mt. of 1,705 ft., in the Scrubby Range, E. of the Middle Murchison. (4) A co. with a coastline at the S. end of Shark Bay, and the river Murchison as its E. boundary.

**Murchison, Sir Roderick Imrey** (1792-1871). British geologist. Born at Tarradale, Ross-shire, Feb. 19, 1792, he was educated at the military college at Great Marlow, and, entering the army, served in the Peninsula War. In 1826 he was elected F.R.S. and in 1828 he toured Auvergne and N. Italy with Sir Charles Lyell, and afterwards carried out geological tours in the U.K. and on the Continent. He reclassified the Palaeozoic rocks and in 1835 suggested the name Silurian for the system first noticed in Wales and later found to be world-wide. In 1838 he published his famous work *The Silurian System*. In 1855 he was appointed director-general of geological survey, and he was president of the Geographical Society many years. He was knighted in 1846, made K.C.B. in 1863, and a baronet in 1866. He died Oct. 22,

1871. *See* Silurian; *consult* Life, Sir A. Geikie, 1875.

**Murchison Falls.** Waterfall on the White Nile. It is 50 m. below Foweira, where the river drops in three cascades to Lake Albert.

**Murcia.** Maritime prov. of S.E. Spain. Between Alicante and Almeria, on the Mediterranean Sea, its area is 4,369 sq. m. It slopes from the mountains in the N.W. which rise in the Sierra de Espuña to an alt. of 5,150 ft., down to the sea. In the coast land to the E. is a large lagoon, called the Mar Menor. Well watered by the Segura and its tributaries, Murcia is fertile, especially in the Huerta de Murcia, where irrigation is practised. The climate is hot and dry; oranges, olives, vines, maize, and other cereals are grown, and mulberry trees cultivated for the rearing of silkworms. The chief towns are Murcia, the capital, and Cartagena. The first Carthaginian possession in Spain, Murcia was occupied in turn by the Romans, the Moors, who made of it a kingdom, and the Spaniards. The old Moorish kingdom, 1223-43, corresponded chiefly with the modern provs. of Murcia and Albacete. Pop. est. 764,120.

**Murcia** (Arab. *Medinat Mursiya*). City of Spain, capital of the prov. of Murcia. It stands on the Segura river, 25 m. W. of the Mediterranean, and 50 m. by rly. N.N.W. of Cartagena. In the centre of the beautiful Huerta (garden) de Murcia, its older parts are crowded, but the new are well built, with fine streets, avenues, and squares. The cathedral, founded probably in 1388, has a Renaissance façade and a tower 480 ft. in height. The bishop's palace is notable, and there is a Moorish granary, now a picture gallery. There is a large trade in fruit. An Iberian town and a Roman colony occupied the site, but the present city was founded by Abd-ur-Rahman II, caliph of Cordova, in 825, afterwards belonged to various Moorish states, and was taken by the Castilians, 1263. It was besieged by the French in 1810 and 1812, and has suffered from inundations and earthquake. The pop. of 221,209 is the seventh largest in Spain.

**Murder.** In English law, the unlawful killing of any human being who is in being and under the king's peace, with malice aforethought, either express or implied. The words "in being" have relation to the slaying of children at the time of birth. Unless the child had a separate existence from its

mother, its death cannot be made the subject of a charge of murder, though since the Infant Life (Preservation) Act, 1929, it may amount to child destruction. "Unlawful" killing means killing without legal justification as is possessed, for example, by a person who slays someone who is trying to kill him; by the public executioner; by a constable who slays a rioter. "Malice aforethought either express or implied" does not necessarily mean actual ill-will. It is rather clumsily said that if there is no lawful excuse for the slaying, or if it was not accidental, or if it was not upon provocation in hot blood, malice will be implied.

Further, there is what is sometimes popularly called "constructive murder," which happens when a man who had no intention to kill does kill when he is in process of doing another felonious act. A burglar who, being interrupted, strikes a blow likely to cause death is guilty of murder if the interrupter dies. Death must take place within a year and a day of the wounding for a murder charge to be brought in England. With certain exceptions the body must be found in a case of murder before the accused can be tried. By English law the judge who tries an alleged murderer must, if there is a conviction, pronounce sentence of death. Sufficient provocation will reduce murder to manslaughter. See N.V.; also Homicide; Manslaughter; Matron; *consul* Just Murder. E. Robinson, 1947.

**Murdock**, WILLIAM (1754-1839). Scottish inventor. Born at Bellow Mill, Ayrshire, Aug. 21, 1754, he became an assistant to James Watt, 1777, carrying out many of the latter's engineering schemes. In 1792 he turned his attention to the possibility of using coal-gas or the gases from the distillation of wood, peat, etc., for illuminating purposes. He erected an experimental plant in 1792, and six years later lit the Soho factory of Watt by gas, the first public use of the new illuminant. Murdock died Nov. 15, 1839.

**Murexide** or ACID AMMONIUM PURPURATE. Substance which crystallises in prisms, showing a beautiful metallic green lustre. It was formerly used in dyeing, but has now been replaced by aniline colours. Murexide was formerly made in large quantities from guano, and can be made by acting on a solution of alloxan and alloxantin by means of ammonia. Also known as Roman purple, it was similar to the Tyrian purple of the

ancients. The latter dye was obtained from a genus of gastropods, *Murex*, hence the name.

**Murger**, HENRI (1822-61). French novelist. Born in Paris, March 24, 1822, he was of German

Henri Murger. French novelist, author of *Scènes de la Vie de Bohème*  
From a sketch by Gavarni

origin. In his youth he passed from one occupation to another, including journalism, until he became famous in 1848 with *Scènes de la Vie de Bohème*. This describes with rich humour and poignant pathos the literary and artistic underworld of Paris, in which much of Murger's life was spent. He contributed to the *Revue des Deux Mondes* and wrote other novels, including *Les Buveurs d'Eau* and *Le Sabot Rouge*, also poems and plays. *Vie de Bohème* was dramatised with success, and was the basis of Puccini's opera *La Bohème*. Murger died Jan. 28, 1861. *Consult* Lives, A. Delvau, 1866; R. d'Héricault, 1896.

**Murghab**. River of Central Asia. It rises in Afghanistan, enters Russian territory (Turkmen S.S.R.), and, after flowing through the oases of Penjdeh and Merv, loses itself in the sandy desert of Kara-Kum. Its length is about 400 m. It is crossed by a branch of the Central Asiatic rly.

**Muridae**. Zoological name for the mouse family of the order of rodents. It includes rats, mice, voles, hamsters, lemmings, and certain others. They are distributed all over the world, and most have naked, scaly tails. Most live on land, though a few are aquatic in habit. See *Hamster*; *Lemming*; *Mouse*; *Rat*; *Rodent*; *Vole*.

**Murillo**, BARTOLOMÉ ESTEBAN (1617-82). Spanish painter. Born at Seville, probably Dec. 31, 1617, he was related to the painter Juan del Castillo, to whose care and instruction he was committed. On Castillo's removal to Cadiz, Murillo

was compelled to join the street artists who hawked their wares in Seville. In 1642 he obtained money by selling coarsely executed but popular subjects to the merchants who exported these goods to Spanish America, and took the road to Madrid, where he was kindly received by Velazquez.

Having returned to Seville, Murillo was commissioned by the friars of the Franciscan convent to paint a series of 11 pictures for their cloister, and began this work in 1646. The payment was beggarly, but the paintings brought fame and commissions. In 1648 he married a rich and noble wife, Doña Beatriz de Cabrera y Sotomayor. In 1654, on the death of Pacheco, he was acknowledged head of the Sevillian school. A series of paintings esteemed among his most celebrated works was begun in 1671 for the church of the Hospital of La Caridad; and three years later he began a famous series for the Franciscan convent outside Seville. These included the *Charity* of S. Thomas of Villanueva, which he was wont to speak of as "his picture." He died at Seville, April 3, 1682.

Murillo excelled in genre, and his realistic scenes from low life are preferred by many to his religious pictures, which are sometimes spoilt by false sentiment and lack of dignity. In the sack of Seville, Marshal Soult carried off a number of Murillo's works, several of which remain in France. There are examples in the London National Gallery, the Dulwich Gallery, and the Wallace Collection. See *illus. Andrew*; *Annunciation*; *Dice*.

**Murmansk**. Arctic city and seaport of the U.S.S.R. On the Kola inlet of the Murman coast, it owes its development to the Murman rly., which directly links it with Leningrad. Projected in 1895, construction of the rly. began in 1915 simultaneously from Murmansk S. and from Zoanka N., the line being completed in 1917. Murmansk harbour is ice-free throughout the year, and the town has a fishing industry and a trade in fish products. Pop. 117,054.

It was the base for Allied troops operating against the Bolsheviks in 1918-19 (see *Murmansk Ex-*

Murillo, Spanish painter  
Self-portrait in Earl Spencer's Collection

pedition), and was later developed by the Russians as the principal base for their Arctic fleet. During the Russo-Finnish war of 1939-40 it was the base for the Soviet attack on the Finnish nickel port of Petsamo. On Dec. 29, 1939, the rly. was cut by Finnish commandos. After the peace treaty Finland was obliged to assist in constructing a rly. through Markajarvi to link up with the Lenin-grad-Murmansk line at Kandalaksha on the White Sea. When Finland joined Germany in the war against Russia, Murmansk became an important objective of the Nazis, who on July 1, 1941, launched a heavy air and land attack against the port and occupied the outskirts. They were driven out by a Soviet counter-attack, and on Sept. 23 suffered heavy losses in another attempt to capture the port. Soviet naval forces based on Murmansk constantly attacked supply ships and transports attempting to maintain the German army. Murmansk was a terminal port for convoys bringing munitions from Great Britain and the U.S.A. From this base Soviet forces advanced into N. Finland and took Petsamo from the Germans on Oct. 15, 1944.

**Murmansk Expedition.** Allied enterprise arising out of the First Great War. In 1918 this region was menaced by Finland, then a vassal of Germany. She had already bargained with the Bolsheviks of Russia for a considerable enlargement of territory.

In Feb.-March, 1918, the British effected a naval landing at Murmansk, and at Pechenga (Petsamo), 100 m. farther W. and close to the Finnish frontier. In June British, French, and U.S. troops occupied the port and adjacent country. The Murman regional soviet at the outset not only offered no opposition, but co-operated with the Allies for the defence of the rly. and territory. On their side, the Allies agreed to recognize the local soviet as the supreme authority, and undertook not to interfere politically. An agreement with the local soviet was ratified July 7, but two weeks later the central Bolshevik govt. countermanded the agreement. In Sept. the Allies pushed down the Murmansk rly., Kandalaksha becoming their base in Oct., and from that centre, in cooperation with the Karelians, they cleared N. Karelia of Bolsheviks and "White" Finns; later in the same month, having advanced S., and occupied Kem, they dislodged the enemy

from the rest of Karelia. By the end of Jan., 1919, the Allies had advanced along the rly. S.W. of the White Sea, and early in March occupied Segeja, about 360 m. S. of Murmansk. The advance continued throughout the summer, the Allies reaching Lake Onega, over 400 m. S. of Murmansk. But by Sept. evacuation of the Murmansk and Archangel areas had begun, and this led at the end of the month to a Bolshevik offensive up the rly. The British troops left the area towards the end of 1919. See Archangel, Expedition to.

**Murner, THOMAS (1475-1537).** German satirist. He was born at Oberehnheim, Alsace, Dec. 24, 1475, became a Franciscan monk, and afterwards wandered from one university to another. His satire, of the most virulent kind, whether spoken or written, was largely directed against the upholders of the Reformation, although he wrote much himself of the need for reform within the Church.

**Murom.** Town of Gorky region R.S.F.S.R. It is 75 m. S.E. of Vladimir, on the Oka and the Kovrov-Murom rly. There is a trade in cereals, metals, timber, sugar, tea, and salt. Murom was an important commercial centre in the 10th cent. Pop. 23,000.

**Murphy, WILLIAM PARRY (b. 1892).** An American pathologist. Born at Salem, Oregon, in 1892, he graduated from Harvard university medical school in 1915, and after a number of hospital appointments became instructor in medicine at Harvard university in 1928. While there, and working in conjunction with Dr. George R. Minot, he discovered the liver treatment method for pernicious anaemia, for which he and Dr. Minot shared the Nobel prize for medicine in 1934. He was awarded the Moxon medal of the Royal College of Physicians in 1933. He published a text book of his system of treatment, *Anaemia in Practice*, in 1939.

**Murray.** Principal river of Australia. It rises in the Australian Alps, and flows N.W. along the borders of N.S.W. and Victoria, and in S. Australia passes through the shallow Lake Alexandrina to the Southern Ocean at Encounter Bay. It has a total length of about 1,609 m. and with its tribs. drains 414,253 sq. m. Its affluents include the Murrumbidgee, with the Lachlan, and the Darling (the main trib.). Important for its fisheries, it is navigable in a great part of its extent, but as a waterway the shallowness of its mouth prevents large ships

entering, though it has rly. connexions at various points on its course. Half-a-mile below the inflow of the Mitta-Mitta is the Hume reservoir, one of the largest in the world. The Murray irrigates one of the chief fruit-growing areas of Australia. See Australia in N.V.

**Murray, SIR DAVID (1849-1933).** Scottish painter. Born at Glasgow, Jan. 29, 1849, he painted landscapes extensively throughout Europe. He was elected R.A., 1905, and his brilliantly coloured scenes of English, Scottish, and continental landscapes became popular. He was president of the R.W.S. in 1917, and knighted the following year. He died Nov. 14, 1933.

**Murray, DAVID LESLIE (b. 1888).** British novelist and journalist. Educated at Harrow and Balliol, Oxford, he was a member of the editorial staff of *The Times*, 1920-44, edited *The Times Literary Supplement*, 1938-44, and as dramatic critic contributed regularly to *The Nation* and *Athenaeum*, 1920-23. His novels, for the most part luxuriant historical romances, included *The Bride Adorned*, 1929; *Stardust*, 1931; *Regency*, 1936; *Tale of Three Cities*, 1940; *Enter Three Witches*, 1942; *Folly Bridge*, 1945.

**Murray, (GEORGE) GILBERT (AIMÉ) (b. 1866).** British scholar. He was born in Sydney, N.S.W., Jan. 2, 1866, and, leaving Australia in 1877, was educated at Merchant Taylors' and St. John's College, Oxford. Professor of Greek at Glasgow university, 1889-99, and Oxford university, 1903-36, he was appointed trustee of the British Museum, 1914. From 1928 he was president of the international committee of intellectual co-operation, and chairman of the League of Nations union, 1923-38. He was awarded the O.M. in 1941.

Acclaimed as one of the most brilliant Greek scholars of his day, his fame rests mainly on his translations of Greek poets and dramatists, recognized as among the

D. L. Murray,  
British novelist

Gilbert Murray,  
British scholar

finest ever made. They include Electra, Medea, Iphigenia in Taurus, Bacchae, and Trojan Women of Euripides (acted chiefly at the Court Theatre, London, 1902-7), Oedipus Rex, 1910, and Antigone, 1939, of Sophocles; Agamemnon, 1920, Eumenides, 1925, and Persians, 1939, of Aeschylus. His numerous works on Greek literature included History of Ancient Greek Literature, 1897; Five Stages of Greek Religion, 1915-25; Aristophanes, 1933; Aeschylus, 1940. He also wrote on problems of the twentieth century in such books as The Ordeal of this Generation, 1929.

**Murray, Sir James Augustus Henry** (1837-1915). British lexicographer. Born at Denholm, Rox-

Sir J. A. H. Murray,  
British lexicographer  
Elliot & Fry

burghshire, he was educated at Edinburgh. During 1870-85 he was a master at Mill Hill School, where he conceived the idea of a new English dictionary. Murray undertook the preparation of a dictionary on historical principles, based mainly on the materials collected by the Philological Society. The first volume was published in 1888. The work had been begun at Mill Hill, but from 1885 was carried on at Oxford, where the Clarendon Press undertook its publication. He was knighted in 1908, and died at Oxford, July 26, 1915. The Dictionary was completed 1928. *Consult* Memoir, H. Bradley, 1919.

**Murray, John.** Name of a firm of British publishers. It was established at 32, Fleet Street, London, in 1768, by John Mac Murray (1745-93), a retired lieutenant of the Royal Marines, who, acquiring a bookselling business, dropped his Scottish prefix.

He issued the first two vols. of D'Israeli's *Curiosities of Literature*. His son, John Murray II (1778-1843), was London agent of Constable, had a share in Scott's *Marmion*, started *The Quarterly Review* in 1809, transferred the business in 1812 to 50 and 50a, Albemarle Street, and published for Byron, Borrow, Crabbe, Jane

Austen, and many others. The business was carried on by John Murray III (1808-92), John Murray IV (1851-1928, K.C.V.O., 1926), and John Murray (b. 1884). In 1917 the firm took over Smith, Elder and Co. and The Cornhill Magazine. *Consult* A Publisher and His Friends, S. Smiles, 1891.

**Murray, Sir John** (1841-1914). British biologist. He was born at Coburg, Ontario, March 3, 1841, and was chief naturalist to the Challenger Expedition, 1872-76, and editor of its scientific reports. He was the author of a number of books and memoirs on marine biology, oceanography, and limnology. He died March 16, 1914.

**Murray, Lindley** (1745-1826). American-English grammarian. Born in Pennsylvania, April 22, 1745, he was a successful barrister, and, having amassed a fortune during the revolutionary war, he came to England and settled at Holgate, near York. His English grammar had a large sale throughout Great Britain and the U.S.A. He died Jan. 16, 1826.

Lindley Murray,  
American-English  
grammarian

**Murrayfield.** Scottish Rugby Union football ground, situated outside Edinburgh, opened 1925. Scotland's home international matches are usually played here.

**Murree.** Hill station of Pakistan in the extreme N.E. of Rawalpindi district, W. Punjab. It is reached from Rawalpindi Cantonment by road (39 m.), and is the starting point for Kashmir by the Jhelum valley. It is on a spur of the Himalayas, alt. 7,517 ft.

**Mürren.** Pleasure resort of Switzerland, in the Bernese Oberland. It is perched on a mountain terrace below the Jungfrau, the Breithorn, the Blumli Alp, and the Schilthorn, 3 m. by cable rly. and electric tramway S. of Lauterbrunnen (q.v.). Alt. 5,385 ft.

**Murrey** or **Sanguine** (old Fr. *moré*, mulberry-coloured). In heraldry, deep blood red colour. It is represented in drawing by diagonal lines crossing each other.

**Murrumbidgee.** River of New South Wales. It rises in the Australian Alps, flows N. in its upper course through the Federal Territory to the artificial lake caused by the Burrenjack dam, thence almost due W. to its junction with the

Lachlan, and, later, S.W. to the Murray. Of its total course of 1,350 m., 500 m. are navigable.

**Murry, John Middleton** (b. 1889). British journalist and critic. Born in London, Aug. 6, 1889, he was educated at Christ's Hospital, and Brasenose College, Oxford. He became a journalist, and served on the editorial staff of the Westminster Gazette, 1912-13, reviewed books for The Times Literary Supplement, 1914-18, edited The Athenaeum, 1919-21, and The Adelphi, 1923-30. An ardent pacifist, with highly original views on religious topics, he edited Peace News, 1940-46. One of the foremost literary critics of his day, with a lively and alert style, he published many volumes of criticism, philosophy, and politics. The best-known included *Countries of the Mind*, 1922 (2nd series, 1931); *Keats and Shakespeare*, 1925; *Son of Woman* (a study of his friend D. H. Lawrence, q.v.), 1931; *Blake*, 1933; *The Necessity of Pacifism*, 1937; *Adam and Eve*, 1944. He married Katherine Mansfield (q.v.) in 1913.

John Middleton  
Murry,  
British writer

**Murshidabad.** Dist. and town of W. Bengal, India. In the Presidency div., the dist. forms the N. part of the Ganges delta, where the river, its main channels known locally as the Bhagirathi and Padma, no longer floods and adds silt to the alluvial plain. The area is 2,063 sq. m. Pop. 1,640,530.

The town stands on the Bhagirathi, and was established in 1704 by the nawab Murshid Kali Khan (after whom the town was named) as the capital of Bengal; it declined after 1790, when Lord Cornwallis transferred the seat of administration to Calcutta. Most of the old buildings are in ruins. Centre of the Indian silk industry, Murshidabad makes bandanas, ivory carvings, gold and silver embroidery, etc. Pop. 15,000.

**Murut.** Primitive people of Indonesian stock in Sarawak and N. Borneo, estimated as numbering 250,000. Shortish and wavy-haired, they are coarser, longer-headed, lankier, ruddier, and less Mongolized than other Bornean peoples. Their customs betoken Philippine contact prior to the Kayan immigration. See Dusun.

**Murzuk** OR MOURZOUK. Chief town in Fezzan, Libya, and an important oasis. The city, founded in 1310, was formerly the capital of the Turkish administration of Fezzan. It owes its importance to its position on the chief caravan route from Tripoli to the W. Sudan. Murzuk was the objective of a raid by the Long Range Desert Group

do not as a rule indicate any disease or disorder, although often associated with indigestion, and if disregarded will soon cease to be observed. In one form, however, they may be symptoms of serious disease of the eye.

**Muscarine.** Poisonous alkaloid found in fly agaric (*Amanita muscaria*), and the fungus *A. pantherina*. It has been prepared artificially by the oxidation of choline with nitric acid. The name is also applied to blue aniline dye.

**Muscat, MOSKAT, OR MASKAT.** Capital and port of Oman, S.E. Arabia. It stands on the S. shore of the Gulf of Oman. Among its exports are pearls, dates, and horses, and its imports include

rice, coffee, sugar, silks, and cotton goods, but much of its trade has been lost to Matrah. Muscat is the residence of a British political

**Muscatel** OR MUSCADEL (Ital. *moscado*). Generic term for wine derived from the parent vine of the same name. A highly alcoholised, sweet, rich wine, either white or red, it is distinguished by a strong musk flavour. Muscatel wine is made in S.W. France, N. Spain, Italy, Sicily, Capri, Corfu, Crete, Cyprus, the Canaries, the Cape, Switzerland, and elsewhere. Of the French, the white Rivesaltes and the red Banyuls are fine wines; of the Italian, Lacrima Christi (*q.v.*) is the most favoured.

**Muschelkalk** (Ger., shell lime). In geology, middle subdivision of the Triassic system of rocks. Typically developed in Germany and many parts of the Continent, they are chiefly limestones rich in the remains of mollusca. The formation is an important source of salt, marls, and gypsum. Rocks of this group do not occur in Gt. Britain.

**Muscle.** Tissue possessing power of contraction by which, in the higher animals, movements are performed. Muscles are divided into two main classes: voluntary (or striped) muscles, the action of which is under the control of the will; and involuntary (or unstriped) muscles.

Voluntary muscles are attached to the bones and are sometimes called skeletal. They consist of masses of fibres, each fibre being about 1 in. in length and 1/500th in. in diameter. Under the microscope the fibres are seen to be marked by alternate dark and light markings (the "stripes,") and this form of muscle is in consequence sometimes termed "transversely striated" muscle. Each fibre is

Muscat, S.E. Arabia. The old fort built by the Portuguese during their occupation of the city

and Free French forces in Jan. 1941, and was captured by Leclerc's forces from the S. in March.

**Musaceae.** Family of monocotyledonous plants, of which the banana is a well-known member. See Banana; Manila Hemp; Plantain; Scitamineae.

**Musaëus.** Greek poet generally known as the Grammarian. He is supposed to have lived about the 6th century A.D., and was the author of a well-known little epic, *Hero and Leander*. There have been many imitations of this charming poem, notably that of Marlowe, completed and published by Chapman, the translator of Homer.

**Musa Ibn Nosair** (640-716). Arabian soldier and administrator. Born at Mecca, he was employed by the Caliph Walid I to complete the conquest of N. Africa, and by 709 had extended the Arabian empire as far as Morocco. He sent to Spain his lieutenant Tarik, who in 711 secured mastery over a great part of the Iberian peninsula. Tarik was joined in 712 by Musa, who overthrew Roderick, the Gothic king of Spain, but was recalled by Walid 714, having been accused of corruption by Tarik. Deprived of his command and sentenced to a heavy fine, he died on his way to Mecca.

**Muscae Volitantes.** Term applied to little black specks, something like flies, which many people see floating before their eyes. They are the shadows of minute bodies in the vitreous humour. They sometimes give rise to alarm, but

agent and consul. It was occupied by the Portuguese from 1508 to the middle of the 17th century, becoming the capital of an independent state again under a native sultan in 1741. To support the sultan of Oman, British troops were in Muscat in 1915, and took part in defeating the disaffected tribesmen, but these operations had nothing to do with the First Great War. Pop. 4,200. See Oman.

Muscle. Top, diagrams showing back and front views of the distribution of the principal muscles of the body and their mode of action. Below, magnified portion of muscle fibre showing nerve ending

surrounded by a sheath, called the sarcolemma, inside which is soft tissue possessing the power of contraction. When a muscle is stimulated by a nerve and contracts, the fibres become shorter and thicker. In some animals and fishes certain of the muscles are red, this being due to the presence of haemoglobin in their contractile substance.

Involuntary muscles are under the control of a different part of the nervous system, and cannot be made to contract by an effort of the will. This type of muscle forms the muscular tissue of the heart, and is also found in the walls of the oesophagus, stomach, intestines, uterus, bladder, blood-vessels, and other organs. The involuntary muscle of the heart is striated, but the involuntary muscle in other parts does not exhibit striations, and is termed "plain" muscle. It is composed of elongated cells about 1/600th of an in. long, each with an oval nucleus and covered with a delicate sheath. See Anatomy; Biceps; Face; Jaw; etc.

**Muscle Shoals.** Rapids of the Tennessee river in Alabama, U.S.A. They form a 37-m. stretch 260 m. above the confluence of the Tennessee with the Ohio. Until the First Great War the 134-ft. vertical fall, with rapids and pools, acted as a barrier to navigation. In 1916 Wilson authorised construction of two dams and two hydro-electric plants to provide power for making nitrates. Wilson Dam, at Florence, completed 1925, is 4,300 ft. long and has two locks, each 300 ft. by 60 ft. It raised the river's discharge from 5,000 to 500,000 cu. ft., and generates 260,000 h.p. Construction of Pickwick Landing and Wheeler Dams by the T.V.A. helped to provide a 9-ft. channel. In 1933 Wilson Dam became a T.V.A. installation.

**Muscovite.** Common member of the mica group of minerals. It consists essentially of potassium aluminium silicate with water and often some fluorine; traces of caesium and rubidium may be present. The mineral occurs as white flakes, sometimes showing hexagonal crystal form. It possesses a remarkable basal cleavage, which allows it to be split into thin flakes, flexible, elastic, transparent, and with low electrical and thermal conductivity. Muscovite is widespread in granitic and metamorphic rocks; commercial deposits are generally found in pegmatites with flakes up to 12 ft. across. Famous deposits are in Bihar, India. Muscovite is used in electrical products. See Mica.

**Muscovy.** Old name for Russia. Derived from Moscow, it means the district around that city, and was generally used for Russia until well into the 18th century.

**Muscovy Duck** (*Cairina moschata*). Species of duck, occur-

Muscovy Duck. Tree-nesting duck, found naturally in Central and South America.

ring naturally in Central and S. America, but largely introduced elsewhere as an ornamental bird for lakes and parks. The birds live in the forest swamps, where they nest in the trees, and their food is almost entirely vegetable. The colour of the plumage is glossy purplish green on the upper parts, with brownish black crested head, neck, and under parts. The male is much larger than the female.

**Musculo-Spiral Nerve.** One of the main nerves of the arm. It arises from the brachial plexus on the outer side of the armpit, winds round behind the humerus, and passes down to terminate in front of the external condyle of the humerus by dividing into the radial and posterior interosseous nerves. It supplies the triceps and other muscles at the back of the arm, and is also the nerve of sensation to the back of the arm and a considerable area of the forearm. Paralysis of the musculo-spiral nerve produces the condition known as dropped wrist. See Arm; Nervous System.

**Muselier, ÉMILE HENRI** (b. 1882). French sailor. From the naval school at Brest, he served with marines and naval gunners before commanding a Q-boat during the First Great War. He was in charge of naval and coastal defences at Marseilles, 1938-39. Muselier went to Gibraltar in June, 1940, and later joined Gen. De Gaulle in England, being appointed commander of Free French naval forces and a member of the council of defence. He landed on the islands of St. Pierre and Miquelon, off Newfoundland, in Dec., 1941, and dismissed the Vichy governor, the inhabitants declaring for De Gaulle. The officer who chose the cross of Lorraine as symbol of Free France, Muselier was obliged to

resign in 1942 owing to ill-health. *Pron.* Mew-zell-yay.

**Muses** or **MUSAE.** In Greek mythology, the divinities who presided over the liberal arts. They were supposed to be daughters of Zeus, nymphs born in Pieria, at the foot of Mt. Olympus; hence they were sometimes called Pierides. Mt. Helicon in Boeotia and Mt. Parnassus on Phocis were also associated with them. Companions of Apollo, they sang to his lyre.

The muses were at first three in number, and nine in later legend. Their names are: Clio, the muse of history, represented sitting with an open scroll; Euterpe, of lyric poetry, with a flute; Thalia, of comedy and pastoral poetry, with a comic mask and a shepherd's staff; Melpomene, of tragedy, with a tragic mask, the club of Hercules or a sword, and the cothurnus; Terpsichore, of dancing, with lyre and plectrum; Erato, of love songs, with the lyre; Polyhymnia, of sacred song, of pensive appearance; Urania, of astronomy, with a staff, pointing to a globe; Calliope, of epic poetry, with tablet and stylus. The Roman nymphs Camenae or Casmeneae were also identified with the muses.

**Musette.** (1) Musical instrument of the bagpipe class, popular in France in the 17th and 18th centuries. (2) A small hautboy, whose tone resembles that of the melody pipe of the one mentioned above. (3) A pastoral dance in duple or triple time. The suites of the 18th century contain musette airs, alternating with gavottes.

**Museum** (Gr. *mousetion*, the seat of the muses). Repository for the preservation and exhibition of objects of natural history, antiquity, science, and art, also applied to the collection itself.

Museums are comparatively modern institutions, few going back to the 18th century. In classical times museums in the modern sense were unknown, that of Alexandria, founded about 280 B.C., being a university building, although it probably contained collections of all kinds. The extensive collection of objects of art and curiosities is not recorded till after the Renaissance. These early collections were known as cabinets of rare and curious objects, cabinets of medals, etc. Probably the earliest was the collection of natural history objects made by Georg Agricola.

The oldest surviving museum established on a sound basis is the Ashmolean (q.v.) at Oxford Bacon

in his New Atlantis elaborated the idea of a great national museum of science and art. The first great typical collection was the British Museum, founded in 1753. Early museums formed by private individuals were Sir Hans Sloane's museum, now the British Museum; Sir Ashton Lever's, of the late 18th century, probably the largest formed by a single person, afterwards owned by James Parkinson, and finally dispersed by auction in 1806. A number of museums, especially some of the larger and more important, were derived originally from collections formed by princes, nobles, etc.

There are numerous varieties of museums. A very broad difference lies in the bodies maintaining them, and they can be classified as national museums, which are maintained by the state and situated usually in the capital; provincial or municipal museums, maintained out of the rates; museums of a semi-public nature, maintained by universities, societies, and schools; and lastly private museums, maintained by private individuals, and sometimes open to the public, as the King John's House Museum, Rushmore, or the Wellcome Historical Medical Museum, London. Private museums usually tend to become public museums. The sacristies of some foreign cathedrals are often opened as museums, and contain ecclesiastical objects, and sometimes other specimens.

#### Art and Science Collections

Museums may also be classified according to the contents and the ideas underlying their arrangement. They are generally differentiated into art and science museums; examples of the varieties are comparative anatomy (Royal College of Surgeons), botany (Kew), geology (London and Berlin), eastern religions (Guimet, Paris), furniture (Geffrey Museum, London), history of London (London and Guildhall Museums), the evolution of man-made objects (Pitt-Rivers, Oxford), folklore (Musée de Folklore, Antwerp), folk or open-air museums (Skansen, Stockholm), war museums, museums of archaeology, shipping, whaling, etc.

A very distinct type of museum is that which illustrates and commemorates the life and work of a person, the museum building being usually the house of, or intimately connected with, the person commemorated. Examples include the Shakespeare museum (Stratford-on-Avon), and Dickens

(Portsmouth), Borrow (Norwich), Wm. Wilberforce (Hull), Dürer (Nuremberg), Beethoven (Bonn), Michelangelo (Florence), etc.

The main functions of a museum are the collection and preservation of specimens and data, which help to widen knowledge by the investigations of experts, and the education and instruction of visitors and students by its exhibits and the method of display. Some museums now have a special portion set aside for children; the U.S.A. first introduced special children's museums. A local museum should mainly deal with the history, natural history, archaeology, etc., of the locality.

By the Sunday Entertainments Act, 1932, museums in England may be open on Sunday in spite of the Sunday Observance Acts, even where there is a charge made for admission.

#### Open-Air Museums

Most museums arrange their exhibits to illustrate particular branches of knowledge, e.g. to show the types of British sea-birds, the ceramic art of China, the evolution of musical instruments, and the distribution of the various types, etc. A form of exhibit common on the continent of Europe is the reconstruction of interiors of rooms, to show the different types of building, architecture, furniture, and modes of living at different periods and in various districts. Particularly noteworthy of this kind were the museums at Zürich, Munich, Amsterdam, Stockholm, Oslo and other centres. An improvement in this direction is the idea first started by Dr. A. Hazelius, at Stockholm, of an open-air museum, later part of the Northern Museum, and known as Skansen. In this way national or local life and history is exhibited in the most attractive manner, with whole buildings preserved and suitably fitted up and furnished, as well as other out-of-door objects, with also exhibitions of folk dances, games, and other pastimes of former days. This type of museum arrangement is common in Scandinavia.

The threat of bomb damage necessitated the removal of most of the exhibits from London's museums during the Second Great War; only such as were too large for easy removal were left in place, protected by blast walls and sandbags. Nevertheless, the London museum contrived a special exhibition for the 1900th anniversary of the city's foundation. For

the rest, the treasures were dispersed in safe places all over the country. Most of the paintings from the National Gallery were stored in a quarry near Blaenau-Ffestiniog, in Wales. Exhibits from the British and Victoria and Albert museums went to Corsham quarries, near Bath; from the Tower of London and the Wallace Collection, to Hall Barn, Bucks, and to West Wickham park; while other valuable national possessions were kept at Mentmore and other country estates, and in the disused part of the Holborn-Aldwych tube rly. Continental museums, less exposed to material damage, were ruthlessly plundered by the occupying Nazis, and German collections, public and private, were enriched by treasures from the Louvre, from Brussels, Amsterdam, Florence, and Copenhagen. With the development of the Allied air attacks, most of these were stored in mines, together with the exhibits from the German museums and art galleries; and this precaution has preserved for mankind treasures of incalculable value, for the greater part of the fabrics of the museums of Berlin, Dresden, Munich, Cologne, etc., were totally destroyed. *Consult* Museums, their History and Use, D. Murray, 3 vols., 1904.

**Musgu Country.** Former dist. of Central Africa, bordering on Bornu and Baghirimi. It occupied a portion of the basin of Lake Chad between the Logone and Shari rivers. The Musgu people are fishers and tillers of the ground. *See* Africa.

**Mush,** MUS, or MOUSH. Town and vilayet of Turkish Armenia. Situated near the Murad Su branch of the Euphrates, it is about 80 m. S. of Erzerum, or 40 m. W. of Lake Van. Before the First Great War it was the natural centre of the trade of a wide district, and contained several mosques and churches. It was the seat of a R.C. and of a Gregorian bishop. Largely peopled by Armenians, it was surrounded by a number of prosperous Armenian villages. In July, 1915, the Turks, having massacred the Armenians in the neighbourhood, took Mush after heavy fighting in the streets. Much of the town was reduced to ruins, and the surviving Armenians were slaughtered or deported. The Russians drove the Turks out of it on Feb. 19, 1916, but had to evacuate it temporarily in Aug., 1916, and abandoned it in the winter of 1917-18. Pop., vilayet, 82,518; town, 28,000.

**Mushki** or **MUSKI**. Ancient people of Aryan relationship in Asia Minor. The Moschi of Greek writers, they inhabited Mushku, the Biblical Meshech (Ezek. 32). They came into hostile contact with the Hittites and Assyrians about 1200 B.C., but were successively subdued by Tiglath-Pileser I, Ashurnatsirpal, and Sargon, who in 709 defeated their king, Mita, a name perpetuated in the Midas of later Phrygian history.

**Mushroom** (*Psalliota campestris*). Purple-spored fungus of the family Agaricaceae. A native of

Mushroom. Spores developing and the threads that spring from them

Britain and the temperate portions of Europe, it occurs profusely in pastures where horses have grazed, their manure affording the most favourable pabulum for the plant. What is known as the mushroom is only the spore-bearing organ or fruit of the fungus, the vegetative portion living in the ground as a ramification of white cottony filaments (*mycelium*), thriving as a saprophyte upon organic waste. At certain points upon the mycelium swellings are produced, which develop into small sporophores completely enclosed in a membrane (*volva*).

The old idea that mushrooms are formed in a night is fallacious, for the process may take many months. Under favourable conditions of warmth and moisture a rapid expansion of the cell structure takes place, similar to that which occurs when a dry bath sponge is dipped into water. The sporophore bursts through the earth, ruptures the volva, and the upper part (cap or *pileus*) expands in umbrella form. Under the cap thin plates set edgewise radiate from the stalk, and on these the microscopic spores are produced in sets of four, aggregating millions. The commoner horse-mushroom (*P. arvensis*) agrees with *P. campestris* in most points, but is considerably larger and more strongly flavoured than is the latter variety.

The cap of the common mushroom is white and silky, at first hemispheric, and later flat, from 3 to 5 ins. across. The plates or gills,

which are at first salmon-pink, become dark amber as the spores ripen. It appears in nature from May to December, but, cultivated in specially prepared beds, where the proper temperature and humidity are maintained, it may be obtained at all seasons. For this purpose caves, cellars, railway arches, and disused tunnels have been used; more commonly they are grown in special houses, or in covered beds outside. These are prepared from fresh stable manure, turned and loosened daily until the fiercest heat of fermentation has escaped; then it is packed firmly to a depth of about a foot on a firm dry base, and boards on edge are firmly fixed along each side to prevent loss of heat and moisture.

When the temperature has dropped to 80° or so, the bed may be impregnated by pressing in pieces of an old mushroom-bed or of so-called mushroom-spawn. These bricks are permeated by the mycelium in a dry and therefore resting condition; they should be broken into pieces about

1 in. square, and dotted all over the bed about 4 ins. apart. The bed should then be evenly coated with finely sifted loam to a depth of an inch, and beaten firm. A covering of litter will help to retain moisture and an equable temperature, which ought not to fall much below 50°. Slight waterings will be necessary to maintain moisture, but only tepid water should be used.

When the mushrooms appear they should be gathered in the unexpanded or "button" stage, as the flesh is quickly attacked by the larvae of flies, which render them unwholesome. Poisoning by eating mushrooms is due either to these being in a decaying condition, or to the appearance in the bed of definitely poisonous species, the spores of which were introduced with the manure. Numerous allied species of fungi are equally good as food, but cannot be grown artificially with the same certainty. See *Agaric*; *Blewits*; *Fungus*; *Hedgehog Mushroom*. Consult *Edible Fungi*, J. Ramsbottom, 1948.

## MUSIC: ART OF ORGANIZED SOUND

Gerald Abraham, Professor of Music, Liverpool Univ.

*This survey of the history and development of a great art is supplemented by articles on individual composers, e.g. Bach, Beethoven, Handel, Mozart, and on Orchestra; Opera; Symphony, etc., as well as on the various musical instruments. See also Harmony; Singing*

Music is the art of organized sound. At what stage in its evolution man began to organize the vocal cries of emotionalised, heightened speech—if indeed such cries did not actually precede articulate speech—and the percussive noises he could make by banging together sticks or stones; at what stage he began to augment these sounds by blowing into reeds or setting a stretched cord in vibration by plucking it or scraping it: all this remains unknown. It lies far back in pre-history and we can only guess at its processes by study of the music of surviving primitive peoples such as the Australian aborigines.

From the dawn of history proper we find man in possession of an art of music, already with symbolic associations attached to groups of sounds (military, ritual, emotional). With the heyday of their civilization, the Greeks had evolved a subtle and complicated system of music, on the theories of which we are fully informed, although, ironically, we know extraordinarily little about how it actually sounded. Nor do we know how, if

at all, it was related to the music of the other Mediterranean peoples of the same period. We can only surmise with some confidence that a few centuries later the music of the early Christian Church drew upon both Hebrew and Greek sources. That early Christian music itself developed several species of chant: the Byzantine of the Eastern Church; the Ambrosian and its less florid offspring, the Gregorian, of the Western; the Mozarabic of Moorish Spain.

The great turning point in musical history occurred when, about the 8th or 9th century A.D., European music began to make use of different sounds simultaneously. From that point onward, while the musics of the Eastern peoples generally developed through (presumably) ever-increasing subtlety of melody and rhythm, Occidental music began to be a polyphonic or harmonic art, and its history is the record of successive attempts to construct polyphonic or harmonic edifices of sound in terms of the prevailing social conditions and

requirements and the resources available for performance. Each attempt reached a peak of technical perfection and produced masterpieces in that particular style; each ended by exhausting the possibilities of its technique and obliging musicians to devise a new one. Thus, broadly speaking, we have periods of pure style in which great masterpieces are most likely to appear, and transitional periods in which the débris of the old technique is mingled with experiments toward the new. Needless to say, this neat pattern is frequently interrupted by the appearance of geniuses who often come too early or too late: Bach was a belated specimen of the style that culminates in his work, while the last works of Beethoven were fifty years ahead of their "due" time.

#### Medieval Church Music

Throughout the Middle Ages musicians were concerned above all with the basing of large structures on the plainsong melodies of the Church. (The secular solo songs of the noble troubadours and *Minnesinger*, and of the common people, followed a simpler course.) The medieval Church composers ran their plainsong chants in mainly parallel courses (*organum*) or combined several chants, sometimes with secular songs and words simultaneously (*motets*), and each development demanded or was made possible by an advance in the notation of music: methods of indicating first the relative, then the precise rise and fall of the voice, then the relative, finally the exact length of each note. The earliest "master" period of polyphonic music came in France at the end of the 12th century and beginning of the 13th, with Léonin and Pérotin. It was succeeded about 1330 by the so-called *ars nova*, in which (among other changes) the old church modes began to show some of the characteristics of the modern major and minor scales, apparent still earlier in the songs of the *trouvères* and troubadours. The outstanding master of the *ars nova* was Guillaume de Machaut, earliest musician to compose a complete setting of the Mass. In the music of this period, and for long after, composition was essentially a matter of combining strands of melody—performed indifferently by voices or instruments or both together or both in alternation—without overmuch regard to harmonic clashes. Successive refinements tended to smoothe out such

clashes, while the tendency of *ars nova* to place the most important part in the highest voice instead of in the tenor was also developed. Successive waves of polyphonic achievement reached their peaks in Dunstable, Dufay, and Binchois (early 15th century); Obrecht, Okeghem, and Josquin des Prés (late 15th century); Palestrina, Lassus, and Victoria (16th century).

By the 16th century, however, the high polyphonic style was no longer practised only in the music of the church. Important secular polyphonic forms such as the madrigal had come into existence, still half-vocal, half-instrumental at will; while instrumental music had developed parallel forms of its own, such as the fantasy. Keyboard instruments other than the organ came into use, and the virginals, a species of small harpsichord, were specially cultivated by the Elizabethan composers of England, headed by Byrd. But from this time onward the names of eminent composers multiply too rapidly for mention.

#### The Earliest Operas

The end of the 16th century saw the birth of important new forms: the opera and oratorio, always closely allied. Opera came into existence through the efforts of a group of Florentine amateurs to recapture the secret of performance of Greek tragedy; they thought they had found it in what we know as recitative (musically declaimed speech) and the earliest operas, such as Peri's *Euridice* (1600) and Monteverdi's *Orfeo* (1607) consisted mainly of recitative. But Monteverdi was no doctrinaire; even in *Orfeo*, and much more in his later works, he refused to submit music entirely to the domination of the word, and he injected frankly melodic elements into his recitative, as well as interspersing instrumental passages. This tendency for music to take the upper hand in opera grew continually stronger for something like a century and a half, particularly in Italy, although in France it was resisted. Since then from time to time "reformers" of the opera have appeared (e.g. Gluck in the middle of the 18th century, Wagner and Moussorgsky in the 19th) to reassert the importance of the dramatic element in opera.

During the 16th century vocal polyphony lost its former predominant position, though instrumental polyphony lived on in the fantasy and kindred forms and in

their later offspring, the fugue. But side by side a new kind of instrumental music was asserting itself: a mainly harmonic kind of music, disregarding melodic lines except in the highest and lowest parts ("melody" as popularly understood, and bass). The filling-in between top and bottom was a matter of more or less artistic routine, seldom written out in full but merely indicated by figures under the bass (*basso continuo*) which would be played simply if by a stringed instrument, with improvised chords if by organ or harpsichord. This texture was used alike for solo songs with lute accompaniment, for instrumental music in opera, for suites of dances, and for sonatas (sets of generally four instrumental pieces, of contrasted speeds).

#### 18th Century Styles

During the first half of the 18th century this kind of texture gradually triumphed over the harmonic polyphony whose last great exponent was J. S. Bach. By the middle of the century the melody-with-accompaniment was completely triumphant in the so-called *galant* style, relatively flimsy in texture, considered by its exponents to be more expressive than the older music. The operatic overture or "symphony before the opera," a set of three pieces (quick-slow-quick), had become so popular that overtures—or symphonies, as they now came to be called—were written independently for performance at public concerts to which anyone who paid could gain admittance—in sharp distinction from older music-making which had been either in ordinary living-rooms or in the halls of palaces or in the open air. In the *galant* style an old instrumental form, the concerto (in which different instrumental groups or soloists were pitted against each other), began to take on a new form in which a soloist was pitted against an orchestra and seized the opportunity to display his virtuosity. The orchestra itself, which right up to Bach's time had been an *ad hoc* collection of instruments, now began to adopt a settled constitution, of which strings formed the basis, with the various wood wind, horns, trumpets, and drums (at first only some of these) in pairs as regular auxiliaries.

More settled and more elaborate instrumental resources made it possible for composers to indicate more precise methods of filling in the harmonic texture. The space between melody and bass could be

filled with instrumental figuration, so that the keyboard *continuo* part became redundant and died out. Similarly, whereas in private music-making (chamber music) the favourite instrumental combination had been two violins, a cello to play the *continuo* part simply, and a harpsichord to play it with harmonic filling-out, the favourite chamber combination towards the end of the 18th century was the string quartet of two violins, viola and violoncello, which was self-sufficient without a keyboard instrument. And the favourite keyboard instrument itself was now the pianoforte, with expressive powers and dynamic range already far exceeding those of the harpsichord and its still weaker brother, the clavichord. The music of this period, above all its instrumental music, reached its highest development in the hands of four composers all domiciled in or near Vienna: Haydn, Mozart, Beethoven, and Schubert, of whom Mozart was also one of the greatest of all opera composers and Schubert virtually, though not actually, the creator of the modern song with piano accompaniment.

#### The Growth of Romanticism

The "Viennese classical period" was succeeded by what is generally known as 19th century romanticism. Romanticism had many facets: exploitation of new orchestral resources and much larger orchestras by Berlioz, Wagner, Rimsky-Korsakov, and others; exploitation of the resources of the piano by Liszt, Chopin, Schumann, and Brahms; opening up of new harmonic resources by several of these composers; closer linking of music with literature and painting. "Programme" music, i.e. music that attempts to imitate or suggest non-musical happenings, pictures, even stories, was nothing new in the 19th century. Every generation had practised it in one way or another either through more or less direct imitation or through associative sound-symbols. But the 19th century was not only fond of programme music, but linked its essays in it with literature and invented a new term to describe this kind of orchestral piece: the symphonic poem. The tendency was carried to its furthest extreme towards the end of the century in the works of Richard Strauss. But the real keynote of romanticism was a kind of personal aggrandisement, most obvious in its exploitation of instrumental virtuosity (pianists and violinists) but also permeating musical crea-

tion. Composers no longer worked as craftsmen first and foremost; they now wrote to express their personalities, wrote piano pieces that were essentially intimate diary entries (Schumann) and symphonies that were spiritual confessions (Tchaikovsky). They claimed the right to be free, despised working to commission. A similar form of self-consciousness led nation after nation to attempt to find its own musical language, usually founded on its folk-song, instead of being content to speak an international musical language with an accent or at most in a dialect; the movement was headed by the Russians in the mid-19th century, while the English brought up the rear at the beginning of the 20th century.

The romantic attitude, the attitudes of art-for-art's-sake and art-as-personal-expression, gradually led through the first quarter of the 20th century to a species of inbreeding, to music so refined and subtilised that only professional musicians or leisured amateurs could understand and appreciate it. The composer wrote for himself or his fellows—and then illogically felt aggrieved because the layman ignored it, preferring a different kind of "modern music," the popular music of the American negro: jazz. During the 1930s this gulf between the contemporary composer and the lay public began to narrow, partly through a natural reaction on the part of the musicians, partly because of government pressure in the totalitarian states where all art must serve an ideology, partly because of economic pressure and inducements (such as the large sums paid for commissioned film music) in the capitalist democracies. Now in the mid-century contemporary music is, if not popular, at least not completely out of touch with the ordinary music lover, particularly since the

latter for his part has so many opportunities to familiarise himself with little-known music through radio and the gramophone.

**Bibliography.** A History of Music in England, E. Walker, 2nd edn., 1924; The Oxford History of Music, various authors, 7 vols., 2nd ed. 1929-34; The Progress of Music, G. Dyson, 1932; The Oxford Companion to Music, P. A. Scholes, 1939; Grove's Dictionary of Music and Musicians, 4th edn., 6 vols., 1940.

**Music, GUILDHALL SCHOOL OF.** Institution for the musical training of amateurs and professional students founded in 1880 by the corporation of the City of London. Its original home was a warehouse in Aldermanbury, and the present fine building with entrance in John Carpenter Street, E.C., was opened 1887 and enlarged 1898.

**Music, ROYAL ACADEMY OF.** London's oldest school for musical training, founded 1822 and opened 1823 at Tenterden Street, Hanover Square. The present building in Marylebone Road, with excellent concert hall, was opened 1911. Diplomas of fellowship, associate-ship, and licentiate-ship (F.R.A.M., etc.) are awarded; and the academy is represented with the Royal College of Music in an associated board for local and school examinations throughout the British empire.

**Music, ROYAL COLLEGE OF.** London institution for musical study and training founded by Edward VII, as prince of Wales, in 1882, as successor to the national training school for music, and incorporated by royal charter in 1883. The premises in Prince Consort Road, Kensington, were opened 1894, a fine concert hall being added 1901. The college owns a valuable library and the Donaldson museum of old and rare musical instruments.

**Music, SCHOOLS OF.** Institutions for musical training in addition to those detailed above are mentioned under the heading School of Music.

#### Musical Box.

Instrument producing music by mechanical means. Clock-work, driven by a spring, moves a cylinder from which pins project at proper positions, and strike the ends of steel vibrators tuned to the notes of the scale, the vibrators and the

Musical Box opened, showing comb and barrel actuated by the clock-work on left

continuous steel plate from which they are cut, and which gives them resonance, forming a sort of graduated comb. Mechanical musical toys of great ingenuity were made as early as the 15th century, especially in the Netherlands; in their present form they date from the beginning of the 19th century, and are still chiefly produced in Switzerland, the country of their origin. Some of the larger specimens contain as many as 36 tubes on one barrel, and allow of exchanging barrels.

**Musical Comedy.** Type of light stage entertainment especially popular in Great Britain and the U.S.A. Similar to the operetta in form, musical numbers being interspersed with spoken dialogue presenting some sort of light-hearted love story, it acquired its own recognizable conventions built around the stock rôles of juvenile lead (or hero), ingénue (or heroine), soubrette, comedians, and chorus. The heyday of musical comedy in England was reached in the first decade of the 20th century, with the London productions of George Edwardes (*q.v.*) at the Gaiety theatre and Daly's theatre, and such popular exponents of the art as Gertie Millar and Huntley Wright.

American influence and the competition of revue gradually altered its character, increasing its liveliness, giving more importance to the star performers, especially the comedians, and emphasising the spectacular aspect, though possibly losing some of its charm.

**Musical Festival.** Music-making on a large scale, the concerts being generally spread over more than one day. In England the oldest is The Three Choirs' Festival of Gloucester, Worcester, and Hereford, founded in 1724, and held annually in the above cities in rotation. Other important festivals, held mostly at triennial periods, were Birmingham, 1768; Norwich, 1824; Leeds, 1858; Bristol, 1878; Cardiff, 1892; and Sheffield, 1895. A London Music Festival was inaugurated by the B.B.C. some years before the Second Great War. Such festivals aim not only at the performance of standard works of known popularity, but also at the encouragement of British art, by commissioning native compositions, and occasionally foreign works, *e.g.* Mendelssohn's *Elijah*, Gounod's *Redemption*. The Glyndebourne (*q.v.*) operatic festival was annual 1934-39. An annual international

festival was opened at Edinburgh in the autumn 1947.

A minor type of musical festival is the competition festival founded on the lines of the Welsh Eisteddfod. There are many of these, great and small, held regularly in different parts of the U.K., and even more in the U.S.A.

**Musical Glasses.** Musical instrument, consisting of glass vessels either selected for their in-

**Musical Glasses.** An ingenious musical instrument of the 18th century  
From *Old English Instruments of Music*  
Methuen & Co.

trinsic notes, or tuned by having water poured into them. Penetrating tones are produced by rubbing the rims of the glasses with the moistened finger. The device, first known in the 17th century, was improved by Richard Pockrich, an Irishman, and became a fashionable entertainment in the middle of the 18th century, being mentioned by Goldsmith in *The Vicar of Wakefield*. It was further developed by Benjamin Franklin, who mechanised it by mounting the glasses on a revolving spindle, their lower edges being made to pass through water. Mozart and Beethoven were among those who composed works for the mechanised instrument, which was alternatively called the harmonica.

**Musical Terms.** Terms used to indicate the various means by which a composer shows the precise character of a musical work. They fall into different classes according to their nature and significance. The first has to do with notation, *e.g.* staff, clef, notes, rests, bars, sharps, flats, etc., and covers pitch, time, and rhythm. The next class embraces terms referring to the pace of the music, such as *allegro*, *moderato*, *andante*, etc., of equal importance being those of the third class affecting style, phrasing, and expression, such as *animato*, *grazioso*, *brillante*, and the like. The dynamic class is concerned

with the various degrees of force required, such as *p.* (*piano* = soft), *f.* (*forte* = loud), *crescendo* (increasing), *diminuendo* (lessening), etc. Many of these terms, with the exception of those in the first class, may be qualified by additional terms, such as *un poco* = a little (*un poco animato* = rather animated), or *non troppo* = not too much (*non troppo allegro* = not too fast). Then come the names of voices, instruments, etc., and next the terms used in respect to melody and harmony, such as *scale*, *interval*, *consonance*, *dissonance*, etc. Lastly, there are purely mechanical directions, *e.g.* *volti subito* = turn over the page quickly, *da capo* = from the beginning, and so on.

The usual language employed is Italian, because in medieval days the great centres of musical instruction were in Italy. The words indicating style, pace, etc., were naturally those in everyday use, but they became conventionalised. Thus *allegro* (gay) now equals quick, and *andante* (going or moving) equals slow. For over a century composers have shown an increasing inclination to use their own language. Consult *Everyman's Dictionary of Music*, ed. E. Blom, 1946.

### **Music and Dancing Licence.**

Official authorisation required before any place can be used for public dancing or music. In London the licences are granted by the L.C.C. An occasional licence may be granted. In Middlesex licences are issued by the co. council. In parts of the Home Counties, mainly those parts within 20 m. of London, licences may be obtained from the co. or co. bor. council. Throughout the rest of England and Wales the licensing justices, *i.e.* the justices who grant licences for the sale of intoxicating liquor, issue also the music and dancing licences, in areas in which the Public Health Acts Amendment Act, 1890, has been adopted or applied. In some other areas local Acts of parliament make special provisions for that area. Where the Public Health Acts Amendment Act has not been adopted and where there are no local Acts no licence is required.

Conditions may be attached to a licence which *inter alia* may relate to the structural arrangements of the building in which the entertainment is to take place. A licence cannot be granted for dancing on a Sunday although a licence may be granted for a musical entertainment which does not infringe Sunday Observance Acts.

Music Hall. Interior of Weston's Music Hall, High Holborn, predecessor of the Royal Holborn, from a print about 1865. Refreshments were served at the tables, while the chairman and his circle of "gilded youth" sat immediately before the stage in the place now occupied by the orchestra.

**Music Hall.** Place of amusement licensed for the performance of music, dancing, and varied public entertainment. It is thus distinct from a theatre, which is intended for the exhibition of stage plays. The variety entertainment of the music hall is a natural development of the informal smoking concert, performers at which were regular frequenters of the tavern. The licensee of the premises next engaged professional singers and, making no charge for admission, recouped himself by the sale of refreshments to members of the audience between the items on the programme, which were announced by a chairman.

Saloon theatres attached to the larger taverns were the next stage, being licensed by the magistrates and permitted to charge for admission to the entertainment, which steadily encroached further upon the privileges claimed by the lessees of the patent theatres. In 1834 a performance of *Othello* at the Britannia, Hoxton, brought matters to a crisis. The producer and performers were fined, but the consequent agitation led to the abolition by parliament of the patents, and to competition wholesome in its effect upon theatres and music halls alike.

The first music hall of the modern type was the Canterbury in Westminster Bridge Road, opened 1849. Others followed, not only in London but in provincial centres, where such enterprises as Moss Empires Ltd. established chains of music halls covering the leading towns, enab-

ling music hall artists to undertake regular tours. Its robust form of entertainment, owing little to the aspirations of culture and refinement but a great deal to broad human appeal in comedy, sentiment, and sensation, made it the ideal entertainment for the so-called man in the street. But with the growing competition of the cinema and of revue after the First Great War the great days of the music hall appeared to have passed, though the old tradition is still here and there maintained. Sir Oswald Stoll (*q.v.*), who ran the London Coliseum, was said to have killed the music hall by making it respectable. It is essentially English in its development, though vaudeville in France and burlesque in the U.S.A. are broadly synonymous terms. Consult *The Story of the Music Hall*, A. Haddon, 1935; *Winkles and Champagne*, M. W. Disher, 1938; *The Early Doors*, H. Scott, 1947.

**Musicians' Company.** London city livery company. Originating from earlier guilds, it was first

Musicians' Company Arms

granted authority over all minstrels within the City by an Act of common council, dated 1500. Later, dancing masters were also included. Under the original and subsequent Acts it exercised control over the profession in the City until late 18th cent. The company administers a number of scholarships and

prizes and a fellowship in music. The clerk's office is at 1, New Court, W.C.2.

**Musk** (*Mimulus moschatus*). Perennial herb of the family Scrophulariaceae and a native of N. America. The above-ground branches and thin, opposite, oblong leaves are coated with soft hairs which up to 30 years ago gave off the well-known musky odour. The plant is now scentless throughout the world. Its yellow tubular flowers have five lobes, and the stigma has two lobes, which are irritable and close together on being touched. Musk, introduced to Great Britain in 1826, is a favourite pot plant, easily raised from the minute seeds, or by division of the numerous underground stems. It requires frequent, copious waterings. Harrison's musk is a larger, cultivated form. See *Mimulus*.

**Musk.** Dried secretion from certain glands of the male musk deer (*Moschus moschiferus*). Its natural purpose appears to be for the attraction of the female. It was long in esteem as a medicine, but now its major use is as a fixative in perfumery. As imported it forms soft, greasy lumps of a reddish-brown tint, giving out the strong, peculiar odour always associated with the name. It can be dissolved in ether. Like civet, it forms the basis of many choice perfumes; and in its natural condition is probably the most enduring of all odours—so long as the substance remains, the odour suffers no diminution. When newly extracted from the deer, however, it is more repulsive than attractive. Artificial musk is used industrially.

**Musk Deer** (*Moschus moschiferus*). Small species of deer found among the mountains of Central Asia. Usually found in pairs, never congregating in herds, it is about 20 ins. high, has a greyish-brown

Musk Deer. Young female of the Central Asian species  
W. S. Berridge, F.Z.S.

pelt, and in certain anatomical features approaches the antelope. Neither the male nor the female has antlers. The upper canine teeth of the male are about 3 ins. long, and project as conspicuous tusks. It is much hunted for the valuable musk, secreted by an abdominal gland, and used as an ingredient in many costly perfumes.

**Muskegon.** City of Michigan, U.S.A., the co. seat of Muskegon co. Situated along Muskegon Lake, through which the Muskegon river enters Lake Michigan, 39 m. N.W. of Grand Rapids, it is served by the Grand Trunk rly. and by steamers plying to Chicago. Michigan timber passed through this port until the opening of the 20th century. Now motor vehicles and machine tools are the major manufactures. Muskegon has a good harbour, which exports fruit and garden produce. Settled in 1834, incorporated in 1861, it became a city in 1870. Pop. 47,697.

**Musket.** General term for any form of smoothbore firearm formerly used by a foot soldier. Muskets were introduced in the latter half of the 16th century. They may be fired by the percussion system or by a flint, or by the application of a match to powder in the pan, hence the terms percussion musket, flint musket, matchlock. The harquebus, snap-haunce, caliver, fusil, and carbine were in all essentials muskets. As late as 1867 the troops in India had seven different kinds of smoothbore firearms, viz. two muskets, four carbines, and a fusil for sergeants. The fusil used the musket ammunition, but was 1 lb. lighter to carry. So-called carbines were of the same calibre as the fusil and about the same weight. The official manual on shooting is still called British Army Musketry Regulations. See Brown Bess; Firearms. Flintlock; Fusil; Guns; Matchlock; Rifle.

**Musketry.** Art of shooting with portable firearms in general, and with the military rifle in particular. Accuracy of small-arm fire as a factor of military importance has been a gradual development of organized warfare. It probably attained its zenith in the S. African War. Every endeavour was thereafter made to train British infantry to become expert shots at all ranges as well as attaining great proficiency in rapid fire. As a corollary, musketry was practically taught for the prone position.

The German army, on the other hand, fostered rapidity of fire rather than accuracy for the gene-

ral body of the troops. This system developed firing from the hip, standing, or kneeling positions as of at least equal value to the prone position, the troops actually firing whilst advancing. The First Great War showed that, despite the use of firearms, opposing infantry were nevertheless

**Musketry.** Standard practice target. A, bull; B, inner; C, "magpie"; D, outer

able to get into close touch.

In the Second Great War automatic weapons, such as the Sten and Thompson sub-machine-guns, largely replaced the rifle. These had a short range, 50-100 yds., and were often used when the firer was moving; so much of the old musketry training gradually fell into disuse. The No. IV rifle, issued during the war, was sighted only up to 500 yds. and was not so accurate as the S.M.L.E., thereby discounting some of the skill of the trained rifleman.

**Musketry, SCHOOL OF.** Military establishment for providing training in the principles of shooting with the rifle. In Great Britain a school of musketry was established at Hythe, Kent, in 1854. It is now a branch of the Small Arms School at Netheravon, and thereat instruction is given in the use of the rifle, revolver, bayonet, and grenade. The courses were remodelled upon the adoption successively of the Snider (1866), Martini-Henry (1870), the Lee-Metford, and other rifles. At the head is a general officer known as the commandant.

**Muskogee.** Second city of Oklahoma U.S.A., the co. seat of Muskogee co. Built near the confluence of the Verdigris and Grand rivers with the Arkansas, 50 m. S.E. of Tulsa, it is served by rlys. The surrounding district produces cotton, oil, zinc, and lime, and industries include the manufacture of lead products, oilwell equipment, road machinery, and tents. There are a state school for the blind, veterans' hospital, and commercial college. A Bacone, 2 m. to N.E., is Indian university. Muskogee was founded in 1870 and became a

city in 1898. During 1900-10 the pop. increased sixfold: in 1940 it was 32,332.

**Muskogees** (Algonquin, Creeks). North American Indian tribe formerly ruling the Creek confederacy. Originally immigrant from the W., they were found by British colonists in the 17th century in Georgia and Alabama, whose many sea-inlets suggested their name. The Creek war, 1813-14, cost them most of their land. By a conveyance, 1852, the Creeks ranked in Oklahoma as one of the five civilized tribes, until their separate nationhood ceased in 1906. In 1915 the Creeks numbered 18,776. The Muskogees give their name to the Muskogean family, which embraces Chickasaws, Choctaws, Natchez, and Seminoles. See American Indians.

**Muskoka.** Region of great natural beauty in the Lakes Peninsula, Ontario, Canada. It contains a river and lake of the same name. From 800 to 1,000 lakes are connected by hundreds of streams all available for passage by canoe. The river rises in the S.W. corner of Algonquin national park, and flows S. to Lake Simcoe, through the E. end of Lake Muskoka. On it the South Falls are notable. The lake is 20 m. long. The region is a summer camping ground for Canadians and Americans, and contains several hotels. Steamers ply on the larger lakes, and the region, which is crossed by the C.P.R. and C.N.R., attracts visitors for hunting, angling, boating.

**Musk Ox** (*Ovibos moschatus*). Large ruminant mammal. Found in the Arctic regions, it is placed by zoologists between the sheep and ox, but is probably a type of sheep. Its flesh is tainted with a musky flavour. It is covered with long, thick, brownish hair, and the horns of the male are wide and flattened on the forehead. Its range is now confined to the ex-

**Musk Ox.** Specimen of the North American ruminant found in Arctic regions

treme N. of America; but formerly it occurred in N. and Central Europe, and bones are found in Great Britain. It lives amid the deep snow of the most barren regions, and seldom long survives removal to Europe.

**Muslim League.** Organization of Muslims in India. Formed in 1906, it had as its immediate aim the achievement by Muslims of a greater share in the control of Indian affairs. During the 1920s there was serious internal dissension, but in 1934 a measure of reconciliation was effected, and on the eve of the first elections held under the Government of India Act of 1935 the Muslim League emerged as a powerful organization.

Under its president, Mohammed Ali Jinnah (*q.v.*), the league worked for Indian independence, but saw a danger of the country being dominated by Hindus. At a meeting in Lahore in April, 1940, a resolution was adopted calling for the formation of a separate nation for Indian Muslims; despite urgent appeals to the Muslims to remain within the Congress party, anti-Hindu feeling grew among them and crystallised into the demand for Pakistan (*q.v.*). Jinnah stated that, without prejudice to later adjustment of larger issues, the league was willing to cooperate with the British in war against the Axis.

The league's claim to represent the 90,000,000 Muslims in India was warmly disputed by several groups. A number still worked in the Congress party for the establishment of a unified independent state. But the influence of the league increased in Sind, Bengal, Assam, and the N.W. Frontier province, and in 1943 Muslim League ministries were formed in Sind and Bengal.

The interim government proposed by the British cabinet mission of 1946 to work out a constitution for an independent India was to contain five members of the Muslim League balanced by five Congress members. On July 29, the league decided to withdraw support from the scheme and launch a policy of "direct action"—which led to mob violence in Calcutta, Dacca, and elsewhere in Aug. Sir Firoz Khan Noon and other leaders renounced all titles conferred on them by the British. When the viceroy, determined to proceed with plans, nominated non-league Muslims to the interim government, the league came into negotiations, and on Oct. 13 five

of its representatives were appointed, though Jinnah declined nomination and his followers boycotted the constituent assembly. The establishment, by the Indian Independence Act of 1947, of an independent Muslim state, Pakistan, embracing W. Punjab, Sind, E. Bengal, Assam, and the N.W. Frontier province, was the triumph of the Muslim League.

**Muslin.** Fine cotton fabric used for dresses, curtains, etc. The name is generally believed to come from Mosul, a town on the Tigris, where the fabric is said to have been first made. Marco Polo refers to muslins of silk and gold made at Mosul. From early times India has been noted for its fine muslins, those of Dacca and Madras being specially delicate. There are also silk muslins, often sold under their French name of *mousselines*, but these are of less importance.

**Muspratt, JAMES** (1793–1886). British chemist. Born in Dublin, Aug. 12, 1793, he was a drug-

James Muspratt,  
British chemist

gist's apprentice, and then served in the Peninsular War with both the army and the navy. Having received a small property after a long chancery suit, he started the manufacture of chemicals in Dublin in 1814, and in 1823 moved to Liverpool, where he began to make soda by the Leblanc process. He opened works at Widnes and St. Helens, and made sulphuric acid. A friend of Liebig, he undertook the manufacture of super-phosphates and artificial manures invented by that chemist. The founder of the South Lancashire alkali industry, Muspratt died in Liverpool, May 4, 1886.

**Muspratt, JAMES SHERIDAN** (1821–71). British chemist. Born March 8, 1821, in Dublin, eldest son of the above James Muspratt, he studied chemistry at Glasgow and University College, London. He took a post under Liebig at Giessen, where he carried out researches on sulphites, toluidine, and nitraniline. Returning to England, he settled in Liverpool, where he died April 3, 1871. His *Dictionary of Chemistry*, 1854–60, a standard work, was trs. into Russian and German.

**Musquash** (*Ondatra zibethica*). N. American rodent, found chiefly in Alaska and Canada. The body

Musquash. Specimen of the small North American rodent (also known as musk-rat), extensively trapped for its fur

with the head measures about a foot, the stout tail is laterally compressed to suit its semi-aquatic habits; the hind feet are partially webbed. Herbivorous, it favours the margins of lakes and ponds, where in autumn it amasses great heaps of edible roots, reeds, and sedges, often plastered with mud on the exterior. Its burrows communicate with this winter food store. Its musky scent-glands have earned for it the alternative name of musk-rat, shared by the unrelated desman (*q.v.*) and the Indian shrew. The musquash is trapped for the sake of its fur. (See Fur.)

Musquash farms were started in the U.K. 1927–28, but the animal did such damage to river banks that an extermination campaign was ordered, and it is now almost extinct.

**Mussel.** Name popularly applied to a large number of bivalve molluscs, but more correctly to the common mussel, *Mytilus edulis*, of the markets. Abundant on the rocks around the British coasts, it is found in great clusters attached by the thread-like byssus which is produced by the foot. It is an important food mollusc, and thrives best around the mouths of rivers, where it obtains an abundance of food; but it is liable to pollution from sewage. Seven species of fresh-water mussels occur in Great Britain, one of them—the swan mussel—sometimes attaining a width of over 7 ins. The pearl mussel occurs in the mountain streams of the N. and W. Fresh-water pearls were formerly highly valued as gems, but they lack the lustre and beauty of the product of the pearl oyster. The pearly shells of some fresh-water mussels are used in U.S.A. for button making. See Mollusca.

Mussel. Duck mussel,  
*Anadonta anatina*

**Musselburgh.** Mun. and police burgh of Midlothian, Scotland. It stands on the Firth of Forth, where the river Esk enters it. It is 6 m. E. of Edinburgh, of which it is practically a suburb, and is connected by rly. and bus. The chief buildings are the old tolbooth, town hall, and Pinkie house. Loretto school occupies the site of a chapel dedicated in the 16th century to Our Lady of Loretto. The industries include fishing, market gardening, and the making of wire, paper, and fishing nets. Musselburgh proper and Fisherrow across the Esk, where there is a harbour for the fishing boats, are united by bridges. The town has fine golf links and a racecourse. The battlefield of Pinkie is near the town. Pop. 20,000. See Loretto; Pinkie.

Musselburgh arms

**Mussert, ANTON ADRIAAN** (1894-1946). Dutch politician, born at Werkendam, N. Brabant. He was chief engineer of waterways in the province of Utrecht, 1927-34. In 1931 he founded the National Socialist movement in the Netherlands, soon making it a replica of the German Nazi party, even to the use of the swastika. Mussert collaborated with the Germans on their entry into the Netherlands in May, 1940, and in 1942 Hitler conferred on him the title of *Führer*. He was arrested by Canadian troops in Utrecht, May 7, 1945; sentenced to death by a special court in Dec., and shot, May 7, 1946.

**Musset, ALFRED DE** (1810-57). French poet, novelist, and dramatist. Born in Paris, Dec. 11, 1810,

Alfred de Musset

the son of a war office official, he was admitted to the circle of romantics of whom Victor Hugo was the chief, and soon established himself as one of its most remarkable members. Early in 1830 he published *Contes d'Espagne et d'Italie*, which met with a cordial reception; and before the year was out his first comedy, *La Nuit Vénitienne*, was produced at the Odéon Theatre, but was not

successful. The set-back was but brief, for with *La Coupe et les Lèvres*, and *À quoi rêvent les Jeunes Filles*, two short plays published in 1832, his importance as a dramatist was immediately recognized.

Two tragi-comedies, *André del Sarto* and *Les Caprices de Marianne* followed, in 1833, and towards the close of that year he set out with George Sand (Armandine Dudevant), who was six years older, for Venice. The two writers had conceived a passion for one another, but after a few months together they separated. This episode was followed by a period of literary activity, marked by the production of some of his finest work. In 1838 de Musset was appointed librarian at the home office in Paris. A few years later

he began to suffer much in health; but in 1845 published his delightful proverb play, *Il Faut qu'une Porte soit ouverte ou fermée* (first acted three years later), and in 1847 had a stage success with *Un Caprice*. He died May 2, 1857.

Great alike as poet, dramatist, and story-writer, de Musset combined fervent passion and great lyrical genius with the finest wit and rare dramatic ability. Two years after his death George Sand published an account of her liaison with him, in the form of a novel, *Elle et Lui*; to which the poet's brother Paul retorted with *Lui et Elle*. De Musset's works were published in ten volumes in 1876. *Consult* Life, P. de Musset, 1877; *Correspondence* de George Sand et d'A. de M., 1904; *Life*, H. D. Sedgwick, 1932. See Sand, George.

## MUSSOLINI: DUCE OF ITALY

C. M. Franzero, writer on Italian Affairs

*The success and ignominious death of the Italian dictator who, seeking to raise his country to a height of glory, pushed her into unimaginable miseries. See also Abyssinia; Italy: History; Italy, Campaign in; and biographies of Mussolini's Italian associates and opponents, Badoglio; Ciano; Matteotti, etc.*

Born on July 29, 1883, at Predappio, a village in the Romagna, near Ravenna, Italy, Benito Mussolini was the son of a blacksmith. He inherited his father's socialist views, and after a short time as a school teacher went as a youth of 17 to Switzerland, where he lived three years, working as a stonemason and at odd jobs, and becoming acquainted with political exiles. Returning to Italy, he became a socialist agitator, and in 1911 was sent to prison for his denunciation of the Tripoli war. On his release he was made editor of the socialist organ *Avanti*, a post he held from 1912 to 14. A pacifist before the First Great War, he changed his views after it started, left *Avanti*, and founded the *Popolo d'Italia*, in which he preached patriotism and intervention in the war. It has been suggested that French gold helped in this conversion. He joined a Bersaglieri regiment in 1915, and in 1917, while out on practice bombing, was seriously wounded and incapacitated for war service. The Caporetto disaster of 1917 produced a mood of defeatism in Italy, to counter which Mussolini formed the *fasci di combattimento*—groups composed at first chiefly of ex-soldiers which adopted the Roman *fascas* as their symbol, and developed later into the Fascist party, growing in strength in the chaotic situation in Italy after the war.

The struggle between fascists and communists went on for some time. Only Mussolini and 30 other fascists secured seats at the elections of 1921; but on Oct. 24, 1922, before a parade of 40,000 fascists at Naples, Mussolini denounced the govt. and demanded a new administration, with five portfolios for his followers. Three days later, with an organization one million strong behind him, he went to Milan, ordered a national fascist rising, and staged a march on Rome, he himself following later by train when on Oct. 30 the king, fearing civil war, invited him to form a govt.

Thus Mussolini took power. Notwithstanding the many excesses of the Fascist régime, the Italian people for long felt content with Mussolini. His rule was from the outset dictatorial. Discipline and obedience were ruthlessly enforced; opponents were silenced; public opinion was coerced, and the press was made an instrument of the régime (1926). Mussolini often kept as many as nine portfolios in his own hands, according to himself privileges once reserved for sovereigns. His title of address was *duce* (leader). But industry

Mussolini, Italian dictator

revived, efficiency increased, and—greatest achievement in the eyes of a nation labouring under a sense of having been treated like a poor relation at Versailles—Mussolini made Italy noticed abroad.

His first opportunity to impress himself upon the world came in 1923, when the Italian delegates to the Greco-Albanian boundary commission were murdered. Imputing the responsibility to the Greek govt., Mussolini demanded an indemnity, and when Greece failed to satisfy him, he seized Corfu. The conference of ambassadors in Paris ordered Greece to pay the sum demanded, an easy success, which proved the starting point in Mussolini's use of the mailed fist.

#### The "Good European"

During 1924-34 he concentrated on internal reforms, the settlement of the Roman question (Feb., 1929) by the Lateran treaty with the Vatican being in particular an indisputable triumph for him. Events in the outer world enabled him to play the good European. In 1925 he contributed to the appeasement of Europe by joining the U.K. and France in the treaty of Locarno as a guarantor of the Franco-German frontiers. In 1933 he induced the U.K., France, and Germany to sign with Italy a four-power pact which, however, was never ratified; and when, in 1934, the Nazis, who had come to power in Germany, attempted their "putsch" in Vienna and murdered the Austrian chancellor Dollfuss, Mussolini responded by concentrating his troops overnight on the Brenner pass, thus staying the German hand. The following spring, he joined the U.K. and France in condemning Germany's denunciation of the military clauses of the Versailles treaty.

But, like all dictators, he was now itching for conquest. The authority of the League of Nations was at its lowest ebb, Italy was in acute economic distress, and a war against Abyssinia, "to avenge the humiliation of Adowa" suffered by Italy in 1896, seemed timely. Attempts by the League to solve the situation by negotiation failed, and in Oct., 1935, Mussolini went to war against Abyssinia. In Nov. the League decided that economic sanctions should be imposed against Italy, but the principal embargo, on petrol, was never enforced. The Abyssinian war was brought to a rapid and successful conclusion by May 5, 1936, and on May 9 Mussolini proclaimed Victor Emmanuel ruler of Abyssinia and emperor of Ethiopia.

The Abyssinian war left Mussolini with a belief that the U.K. and France were unable to resist any quick action by fascist Italy, and

Mussolini. The Italian duce, seen at his study table in the Palazzo Venezia, Rome

in a spirit of personal revenge against the "democracies," which had tried to thwart him in his conquest, Mussolini threw Italy into the arms of Nazi Germany, with which he formed the Rome-Berlin axis, Oct. 25, 1936. Mussolini's intervention in the Spanish civil war followed. This was most unpopular in Italy and drained the treasury without bringing any benefit to the country; but it confirmed Mussolini's belief that the western democracies were unable to resist an armed attack. In Sept., 1938, the British premier, Chamberlain, appealed to Mussolini to influence Hitler in favour of a settlement with Czechoslovakia, and Mussolini was at Munich able once more to act the good European. Great Britain threw him a bouquet by recognizing the Italian empire and signing an Anglo-Italian agreement. But France took up an attitude of antagonism, to which Mussolini responded with the cry, "Nice, Savoy, Corsica, Tunis!" On Good Friday, 1939, Mussolini invaded Albania; and on May 22 he sealed his fate with the conclusion of a treaty of alliance with Nazi Germany.

When the Second Great War broke out, Mussolini maintained for nine months a policy of "non-belligerency," miscalculating his chances, however, in 1940 by declaring war, June 10, against a U.K. and a France apparently already doomed.

France was defeated, and Mussolini had the satisfaction of entering Nice like a conqueror. But he knew nothing of the British mind and character, and had never listened to counsel. His attack on Greece in Oct. proved a catastrophe. The campaign in N. Africa at first

went better, and Mussolini actually went to the front there, prepared to ride into Alexandria in triumph. But both his and his German ally's forces were eventually driven westward. By May, 1943, he had lost all Italy's African territories, and with the Allied attack on Sicily in July the very soil of Italy was invaded.

The whole land was now seething with discontent, desiring only an end to the war. In an attempt to secure help from Hitler, Mussolini met him at Feltre on July 19; Hitler demanded that the country should be evacuated as far N. as the river Po. He returned to Rome, and at a meeting of the fascist grand council on July 24 (the first time since Dec. 7, 1939) it was moved by Grandi, according to a secret preconceived arrangement, that the king should resume command of the armed forces. Mussolini, taken by surprise, opposed the proposal violently; but it was accepted after a day of stormy debate. Mussolini went to appeal to the king, only to be asked for his resignation and taken into "protective custody" by his former chief of general staff, Badoglio (*q.v.*), who formed a provisional govt. to sue for peace with the Allies.

#### Mussolini in Defeat

Mussolini was moved to a winter sports hotel at the top of the Gran Sasso, highest mountain in the Apennines. From there he was rescued by German SS. parachutists, then picked up, with his rescuers, by a Fieseler-Storch aircraft, which landed on a plateau near by, and carried off to meet Hitler in Germany. He did not risk a return to Rome, but moved to Salo, on Lake Garda, where he set up a quivering fascist republic, so adding civil war to the miseries of the Allied campaign against the Germans in Italy. He moved later to Bergamo and then to Venice. One of the first acts of his new "government" was to prescribe the death penalty for violation of the fascist oath of loyalty to the *duce*, and under this the members of the fascist grand council who had voted against him on July 24 were tried at Verona—all except six in their absence. Ciano, his son-in-law, de Bono, and three others were shot Jan. 11, 1944.

When the German surrender in Italy was near, Mussolini tried to escape to Switzerland. He was captured April 28, 1945, by Italian partisans at Dongo, Lake Como, taken to the near-by village of Giuliano di Mezzegare, and there

shot after a 10 minutes' trial, together with his 25-year-old mistress Clara Petacci and 12 members of his "government" who had been trying to escape with him. His corpse and that of Clara Petacci were taken to Milan and hung heads downward in the Piazza Loreto. His body, buried in a secret unmarked grave in a Milan cemetery, was exhumed a year later by fanatical fascists. It was found in Aug. in the Carthusian monastery of Pavia and reburied secretly.

Thus ended Benito Mussolini, the *duce* once idolised by the Italian people and no negligible force in European affairs. Mussolini was a man in whom intelligence was misguided by ambition and vanity, imagination thwarted by his passions. His greatest error was perhaps that he deluded himself into believing that he could resurrect the glories of ancient Rome, although Italy was poor by comparison with those he made his enemies, whereas Rome had been wealthy. Whatever the value of the technical and industrial improvements he introduced into Italy in his earlier years, he left her ruined. His private life was one of notorious irregularities. Physically, he was short, but with a striking face and magnetic eyes; and although in his time of success inclined to corpulence, he liked to display great activity, riding, motoring, and piloting his own plane.

**Mustagh-ata.** Mt. peak in the extreme W. of Sinkiang, China. An E. outlier of the Pamirs (*q.v.*) it reaches an alt. of 25,760 ft.

**Mustang** (Span. *mestrenco*, a strayer). Name applied to the wild horse found on the prairies of Mexico and California. They are not natives, but believed to be the descendants of horses introduced from Europe by the Spaniards at the time of their conquest in the 16th century. See *Horse*.

**Mustang.** Single-seat fighter aircraft designed by the North American Aviation co. in the

Second Great War. Moderately successful with the Allison engine on its introduction into squadron service in 1941, the Mustang was repowered with the British-designed Packard Merlin, and became an outstanding all-round fighter. The U.S. army, to whom the Mustang was known as the P-51, added to its effectiveness as a long-range escort by fitting drop tanks. Top speed of the Mustang without these tanks was 470 m.p.h. After the war came the P-82 Double Mustang, with two engines and two tail-carrying booms. See *Aeroplane* illus. p. 131.

Mustard. Foliage, flowers, and seedpods of charlock

**Mustard** (*Brassica*). Name given to annual herbs of the family Cruciferae. They are natives of Europe, Asia, and N. Africa. There are three British species known as mustards—black (*B. nigra*), wild mustard or charlock (*B. arvensis*), and white (*B. alba*). These are by some authors separated to constitute the genus *Sinapis*. They are bristly, branching plants from 1 ft. to 3 ft. in height, with variously lobed leaves and yellow flowers, and long rounded seed pods. In the black mustard these stand erect and close to the stem; the prefix has reference to the dark coloured seeds. In the other species the pods stand out from the stem, and the seeds, which in charlock are brown, are in white mustard yellow.

The salad mustard and cress consists of young plants of both species in the seed-leaf stage.

The standard for mustards was defined by an order issued in 1944. "Brown mustard flour" means the product obtained by grinding whole seeds of *B. nigra* or *B. juncea*, or a mixture of them. "White mustard flour" is defined as the product obtained by grinding whole seeds of *Sinapis alba*. The standard for mustard, compound mustard, or mustard condiment is specified in the schedule to the order as of such composition as to yield not less than 0.35 p.c. of allyl isothiocyanate after maceration with water for two hours at 37° C. If amylaceous flours and spices are used the proportion must not exceed 20 p.c. by weight.

**Mustard Gas.** The use of this asphyxiating chemical is described under *Chemical Warfare*.

**Mustard Oil.** An essential oil, a colourless liquid with a pungent smell, which causes a flow of tears and blisters the skin if allowed to remain on it for a short time. It is obtained from the seeds of black mustard, *Brassica nigra*, and contains a high proportion of allyl isothiocyanate. Artificial oil of mustard, obtained by heating allyl bromide in alcohol with potassium thiocyanate, is largely used in place of the natural oil.

**Mustelidae.** Family of carnivorous mammals, comprising the weasel tribe. It includes the weasels, martens, polecats, stoats, skunks, badgers, otters, etc.

**Muswell Hill.** Residential district of London. In the county of Middlesex, it lies to the N. of Highgate and the E. of Finchley. The name is derived from a well at the top of the hill, one of the low range running through the county. It is well served by rly. and other forms of London Transport. In the district is Alexandra Palace (*q.v.*), while many Scots have made their homes here.

**Muswell Hill Murder.** British murder case. On the morning of Feb. 14, 1896, Henry Smith was found lying dead in the kitchen of his house, Muswell Lodge, N. London, and from the safe £100 in gold was missing. In the kitchen was found a toy bull's-eye lantern, the property of the brother-in-law of one Albert Millsom. He and an associate, Henry Fowler, were missing, and also found to have been well supplied with money after the outrage. They were traced to Bath and captured after a struggle. Millsom made a statement putting the blame for the murder and the robbery on Fowler. While awaiting the jury's verdict, Fowler made an attack on Millsom in the dock and almost murdered him. Both men were hanged.

**Mut.** Egyptian goddess. Forming with her consort Amen-Ra and her son Khonsu the Theban triad, she had her chief temple S. of Karnak. Mistress of the sky, she appears in human form wearing a vulture head-dress and the double crown of Egypt. See *Karnak*.

**Mutation.** Term applied to the sudden appearance of a new character in a race of organisms. It was applied by de Vries at the end of the 18th century to new forms of *Oenothera lamarckiana* appearing on waste land near Amsterdam and subsequently among offspring of normal plants raised under controlled conditions. De Vries found the mutants (new forms) could pass their

peculiarities on. Because of this, and the marked differences between the mutants and their parents, he concluded that evolution occurs by sudden steps rather than by the slow accumulation of small differences suggested by Darwin.

Unexpected forms having markedly new characteristics have for long been known to horticulturists as sports; and the appearance of new characters is not uncommon in both plants and animals. Many such mutants are found to differ from the original stock in their chromosome complements, e.g. by the presence of extra members or even additional sets of chromosomes. Other mutants yield genetical evidence of a change having occurred in one or other of their genes, a change probably comparable to a change in chemical constitution and called a gene mutation. See Evolution.

**Mute** (Lat. *mutus*, dumb). Word used in several connotations. Primarily it denotes a person congenitally lacking the power of speech, or who has been deprived of it by long continued deafness, then called a deaf mute. (See Deafness.) The term is also applied to a person who, though able, refuses to speak, and specifically in law to one who "stands mute."

If a prisoner, called on to plead guilty or not guilty, makes no answer, a jury decides whether he is mute of malice or by visitation of God. If he is found mute of malice a plea of not guilty is entered and he is tried. If he is found mute by visitation of God the jury next decides whether he is fit to plead; if so, he may plead by signs or writing; if not, he may be detained during the king's pleasure.

An old funeral custom in Great Britain, now almost obsolete, was the presence of attendants supplied by the undertaker and called mutes. Wearing voluminous black cloaks and crepe bands hanging from their hats, they stood outside the door of the house from which the corpse was to be brought, holding staves tied up with large black bows and streamers. These figures were survivals from ancient Roman funeral ceremonial at which black-garbed officials, called *lictors*, attended the undertaker or master of the ceremonies, called *designator*, and marched with him beside the corpse to the place of burning or burial outside the city.

In music, mute is the name of a mechanical device for softening or deadening the sound of an instrument. For stringed instruments

of the violin family the apparatus is of wood or ivory, and is affixed to the bridge; while on instruments such as the piano it is a pad applied by a pedal arrangement. In brass instruments it takes the form of a leather pad inserted in the bell. The words *con sordina*, or *muta*, indicate when the mute is to be employed, and *senza sordini* when it is to be discontinued.

In philology, mute is the term applied to letters which are not pronounced, such as b in *dumb*, and to consonants whose sound is abruptly checked by complete closure of the vocal organs. Mutes are voiced—b, d, g—and unvoiced—p, t, k.

**Mutilation** (Lat. *mutilare*, to lop off). In anthropology, a bodily disfigurement effected under social sanction. Practised throughout human history, it is an artifice having an amuletic, ornamental, or useful purpose. It is prompted by self-consciousness, desire for social distinction, magico-religious or hygienic considerations, or inexplicable tradition, and is often attended by rigid ceremonial observances. Distinguishable from the penal disfigurement of slaves, captives, and criminals, and the austerities of religious ascetics, it is usually intended to attract, not to repel, ranking as a mode of personal enhancement or decoration.

**MUTILATION CUSTOMS.** Skin-mutilations include shaving and eradication of hair, even to the eyebrows, raising of scars by cutting or burning, often as tribal badges, and puncturing of designs by needle-tattooing, especially in E. Asia. Amulets may be embedded in artificial warts. Chinese ascetics affect elongated fingernails.

Finger-joint amputation, attested by Palaeolithic cave-drawings, is widely practised in aboriginal Australia and S. Africa for mourning; in Mysore as a birth-custom and later symbolically; in Tonga and Damaraland in time of sickness; and among the Mandan Indians as an initiation rite. The former foot-compression of high-born Chinese women may be compared with the deformity occasioned by high-heeled shoes in Western civilization. Constriction of the waist or limbs by irremovable rings or bands, and breast elongation occur. The Nilotic Lango in E. Uganda pierce the navel for brass rings and bead ornaments.

Head-deformation has been widely practised since Neolithic times. Polynesian noses are often flattened. The upper ears may

have 13 punctures, as in India, or the lobes be punctured and distended until they rest upon the shoulders, as in the Solomon Islands. Melanesian noses, S. American and Nyasaland lips, and Eskimo cheeks may be pierced for plugging. Bongo lips are distended, and Senegal lips artificially swollen. The tongue may be pierced, and some Saharan peoples excise the soft palate in infancy. Tooth-mutilation characterises chiefly the dark-skinned peoples. See Circumcision; Head-Deformation; Tooth-Mutilation.

**Mutiny** (Fr. *mutin*, rebellious). Collective insubordination of soldiers, sailors, or airmen. This offence is at all times punishable by death after conviction by court-martial. In Great Britain the Army Act provides for the redress of wrongs by enabling any officer or soldier as an individual to state his grievance to the Army Council, or to a general officer, but the combined complaint of several is never permissible. A soldier cannot be punished for availing himself of his privilege to complain, even if his complaint should be considered frivolous.

On the other hand, anything in the nature of a conspiracy to refuse service, or promote sedition, for any reason whatever, is deemed mutiny, and any person subject to military law who joins in it, or fails to use his utmost endeavours to suppress it, is culpable, even though the conspiracy should prove abortive. It should be noted that the term mutiny formerly included other acts of insubordination by a soldier, and thus the old Mutiny Act embraced most of the military offences now dealt with by the Army Act. The death penalty is hardly ever inflicted when refusal to obey an order is collective, or when the mutinous act is not performed in face of the enemy. See Army; Army Act; Mutiny Act.

**Mutiny Act.** Law originally passed in England in 1689 to punish insubordinate soldiers and deserters from the army by a military tribunal. The need for this became evident when 800 men who had enlisted to serve James II refused to embark for Holland at the bidding of William III. The duration of the Act was limited to seven months, but it was re-enacted every year with few intervals down to 1878, when its provisions were embodied in the Army Discipline and Regulation Act of 1879.

The Mutiny Act operated only in respect of troops at home, since articles of war were issued by the

crown to govern troops on active service or otherwise employed overseas. But in 1803 it became the legal authority for making articles of war, which had from Tudor times, and even earlier, been regarded solely as a prerogative of the crown, to be exercised only in time of war. As the law of the land could not be set aside in time of peace, the only help which parliament afforded the military authorities in maintaining discipline before 1689 was to make desertion punishable before a civil tribunal as a felony, apparently on the theory that a deserter had made away with a military equipment furnished at the cost of his captain. The Mutiny Act was therefore the beginning of legislation which recognized that the army in peace as in war required a special disciplinary code.

**Mutsu-hito** (1852-1912). Emperor of Japan. Born at Kyoto, Nov. 3, 1852, he succeeded his father, Osahito, in 1867, coming to the throne at a critical time in the history of Japan. The country had just been opened up to foreigners, and among the conservative element there was considerable discontent. Mutsu-hito favoured Western ideas and cleared the way for their introduction by various measures. He abolished the shogunate, and in 1869 moved his capital from Kyoto to Yeddo, which he renamed Tokyo. Railways were introduced in 1872, the European calendar came into force, and the study of English became general. Victorious wars with China, 1894, and Russia, 1904-05, strengthened his power, which was consolidated in 1910 by his alliance with Great Britain. He died in Tokyo, July 29, 1912. See Japan.

**Mutton** (late Lat. *multo*, sheep). Flesh of sheep. It contains less protein and more fat than beef. The breeds of sheep for mutton production include Lincoln, Leicester, Border Leicester, Scotch blackface, Shropshire, South Devon, and Welsh, together with crosses from these breeds. Immense quantities of frozen and chilled mutton are imported into Great Britain, especially from New Zealand and Australia. See Diet; Meat.

**Muttra**. District and town of India in Agra division, Uttar union. The dist. is situated on both sides of the Jumna and grows wheat, barley, millet, and gram. Three-quarters of the area is tilled, and one-quarter is irrigated, rainfall being only 25 ins. per annum. Area 1,447 sq. m. Pop. 806,992.

The town, the reputed birth-place of Krishna, is an ancient sacred city on the Jumna and an important rly. junction. It has been inhabited since 600 B.C., and in the Buddhist era contained 20 monasteries with 3,000 monks. Among the fine buildings, are the Jama Masjid, 1662, and the mosque of Aurangzebe, 1669. The Curzon museum of archaeology was opened in 1933. Pop. 76,716.

**Muybridge, EADWEARD** (1830-1904). British photographer. Born at Kingston-upon-Thames, his original name being Edward James Muggeridge, he emigrated to the U.S.A. and became director of photographic surveys. His first attempt at depicting motion by photography was in 1870, when he took a series of photographs of trotting horses and demonstrated that the conventional idea of trotting was incorrect. In 1881 he invented the zoopraxiscope, the forerunner of the cinematograph. He made photographs of animals in motion, upon which he published works which have become standard: *The Horse in Motion*, 1878; *Animal Locomotion*, 11 vols., 3rd ed. 1907; *The Human Figure in Motion*, 3rd ed. 1907. These works contain over 100,000 motion photographs. See Cinematography.

**Muzaffar-ed-Din** (1853-1907). Shah of Persia. Born March 25, 1853, he succeeded his father, Nasr-ed-Din. In 1896. His extravagant tastes forced him to raise loans from Russia, 1898-1900, thereby rousing suspicion of Russian motives in Great Britain.

Muzaffar-ed-Din,  
Shah of Persia

He visited St. Petersburg and Paris in 1900. In 1902 he was entertained in England by Edward VII, and received the order of the Garter. Continued maladministration and waste stirred up discontent until he was forced to grant a constitution in 1906. He died at Teheran, Jan. 8, 1907. See Persia: History.

**Muzaffargarh**. Dist. and town of Pakistan, in the Multan division of W. Punjab. The dist. is situated in the S., with the Indus on the W. and the Chenab and Panjnad on the E., and terminates at the confluence of the Indus and Panjnad. The annual rainfall is 6 ins. Wheat is grown upon irrigated or inundated land. The town stands on the right bank of the Chenab,

where the rly. crosses the river, and has grown round a fort built by Nawab Muzaffar Khan. Area, dist., 5,605 sq. m. Pop. dist., 712,849; town, 5,000.

**Muzaffarnagar**. District and town of India, in the Meerut division of the Uttar union. The dist. lies between the Ganges and Jumna N. of Meerut dist. Wheat and barley are the chief crops. The annual rainfall is 30 ins. The town is situated near the middle of the dist. and has rly. connexion with Meerut and Delhi. It was founded by Mazaffar Khan Khanjahan about 1633. Its area is 1,682 sq. m. Pop. dist., 1,056,759; town, 29,100.

**Muzaffarpur**. Dist. and town of India, in the Tirhut division of Bihar state. The dist. lies N. of the Ganges, and is mainly a flat alluvial plain drained by the Gandak rivers. Its area is 3,025 sq. m. The only limitation of human settlement is the marshes, most of which represent deserted river beds, for none of the rivers of the plain is here stable. Most of the district contains over 1,000 people per sq. m.; and about three-quarters of it is tilled. More than half the area yields two crops a year, chiefly rice and pulses. The town, built near a deserted bed of the Little Gandak river, is the divisional as well as the district headquarters, and a centre for the declining indigo industry. Pop. dist., 3,244,651; town, 54,009.

**Muzzle**. Properly and originally the snout, i.e. the jaw and mouth of an animal. It is also used by analogy for the mouth of a gun, and for the covering placed over the mouths of dogs or other animals to prevent them, when necessary, from eating or biting. See Muzzling Order.

**Muzzle Blast**. Term in ballistics (*q.v.*) to denote the rush of propellant gases past a projectile at the instant its base leaves the muzzle of a gun, rifle, or other firing-piece. About  $\frac{1}{3}$  of the total energy of the explosion when a round is fired in the breach is wasted in the form of muzzle blast;  $\frac{1}{3}$  is absorbed in heating the various parts of the weapon; and only  $\frac{1}{3}$  is kinetic energy which propels the projectile.

**Muzzle Energy**. Kinetic energy of the propulsion and rotation of a projectile at the instant it leaves the barrel of a firing-piece on discharge. The energy generated by the explosion of the charge in a Lee Enfield rifle is 7,312.5 ft.-lb., of which 2,333 ft.-lb. is muzzle energy.

**Muzzle Velocity.** Maximum velocity of a projectile during its flight from the firing-piece barrel to the target. This maximum is achieved not at the actual instant the projectile leaves the muzzle, but a few inches in front of it. Actual velocity at the muzzle is the sum of muzzle velocity and muzzle blast (*q.v.*) the latter being expended immediately the projectile clears the barrel. The M.V. of a rifle is 2,400 ft. per sec., and rapidly drops.

**Muzzling Order.** A measure adopted by public authority in various countries to stamp out rabies (*q.v.*). Although other animals are liable to the disease, dogs are its principal victims, and experience has shown that the best means of extinguishing it is compulsory muzzling within large districts, and the quarantining of all imported dogs, or absolute exclusion. In Great Britain the method was first tried systematically in 1897. In 1900 the order was rescinded, no case having occurred throughout the country for six months. In consequence of a recurrence of rabies in Cornwall and Devon, the muzzling order was reimposed for a time over certain districts in 1919.

**M.V.D.** Political police of the U.S.S.R., administered by the ministry of the interior, the Russian name for which is abbreviated to M.V.D. Earlier names of the organization, based on earlier names of the same govt. dept., were Cheka, OGPU, N.K.V.D. See OGPU.

**Mweru** or **MOERO.** Lake of Central Africa. It lies W. of Lake Tanganyika and between the Belgian Congo and N.E. Rhodesia. It is 68 m. long and has an average breadth of 24 m. It is fed by the Luapula river. To the E. of the lake is the Mweru Marsh game preserve, one of the chief breeding grounds of the elephant. The lake, which is navigated by steam launches, was discovered by Livingston in 1867. Marshes for 30 m. from the S. end indicate a greater extent in past years, and certain fish with amphibious habits, a relic of the Silurian period, attest the great geological age of the lake.

**Myall.** Australian tree, one of the acacias. There are two kinds, one of which resembles the weeping willow. Its wood is much used for making tobacco pipes and handles for whips.

**Myasthenia Gravis.** A rare disease of the muscles. It is characterised by extreme fatiguability, which goes on to paralysis. Muscles supplied by the cranial nerves

are most commonly affected. The cause is unknown, nor is the exact nature of the defect understood. Normal transmission of impulses from the motor nerves to the voluntary muscles seems to depend upon the liberation at the ending of the nerves of acetylcholine. In this condition that subtle chemical substance is probably not elaborated, or is even destroyed. The condition may terminate fatally in from one to three years, or may run on for 20 years. Specific treatment consists in giving physostigmine, the synthetic form of which is prostigmine; this effects a dramatic improvement for a few hours.

**Myaung-Mya.** District and town of Burma, in the Irawadi division. The dist. is on the W. side of the great delta, and has an annual rainfall of 100 ins. Rice is the only crop. The town is a progressive fishery and trading centre and small port. Area, 2,642 sq. m. Pop., dist., 488,031; town, 8,250.

**Mycalē.** Classical name of a mountain of Asiatic Turkey, now known as the Samsun Dag. Famous for the great naval victory the Greeks won over the Persians in its neighbourhood in 479 B.C.,

it stands on the W. coast, opposite the island of Samos. The battle ended Persian rule in Ionia.

**Mycelium.** Term used in botany for the branching system of fine threads which constitute the vegetative body of most fungi. The threads or hyphae have tubular non-living walls containing cytoplasm and nuclei. In basidiomycetes and the ascomycetes, partitions (septa) cross the hyphae at intervals separating the protoplast into parts which may contain one or several nuclei each according to the type of fungus. In phycomycetes, septa occur typically only to cut off reproductive organs and damaged or senile parts of the hyphae, which, of many soil fungi, grow adpressed in bundles (rhizomorphs).

**Mycenae.** Ancient Greek city of Argolis in Peloponnesus. It was the capital of Agememnon, overlord of the Achaeans of the Iliad. Its citadel or acropolis was occupied early in the Bronze age, and about 1600 B.C. it was ruled by a rich dynasty whose rock-hewn tombs, the famous shaft-graves, were excavated by Schliemann in 1876. They contained gold and silver ornaments, including gold masks, and arms,

Mycenae. Excavations in the ruins of the ancient Greek city. 1. Treasury of Clytemnestra. 2. Part of a large house, built about 1400 B.C. 3. General view from the west, with the famous Lion Gate in the distance

vases, and utensils. Mycenae was closely connected with Crete and commanded the trade route from the Aegean to northern lands. The quantity of Baltic amber found in its graves shows the widespread nature of its trade. Its greatest prosperity was reached about 1400, when it took the place of Cnossus as the leading Aegean power. The palace, the cyclopean walls of the Acropolis with their Lion Gate, and the domed tombs of beehive shape, chief among them the Treasury of Atreus, belong to this period.

The tradition of the siege of Troy, believed to have taken place about 1200, probably represents some great struggle of the final phase of the Mycenaean kingdom. The Iron age then began in Greece, and about 1000 the Dorian invaders arrived from the north. Mycenae fell and its palaces were burned, but the town lived on as a small city state, though Argos now held first place in the region. The Argives finally destroyed Mycenae in 468 B.C., after which it was virtually a ruin to be visited by Greek and Roman tourists. See Aegean Civilization.

**Mycetozoa** or **MYXOMYCETES**. Class of organisms variously regarded as low forms of animals (Protozoa), and as slime-fungi. They live in rotten wood, decaying leaves, and similar organic waste. Beginning life as microscopic spores, they rapidly become, in moisture, amoeba-like swarm-cells that glide through the decayed material, and feed upon bacteria by enveloping them in their jelly-like substance. They multiply in this stage by division; and later vast numbers unite into a cream-like mass (*plasmodium*) that flows out to the exterior of the leaf or tree-stump.

In the swarm-cell state they avoid the light, but the plasmodium is attracted to it. After a few hours of the flowing movements, the plasmodium invests itself in a firm crust, beneath which it breaks up into millions of microscopic spores again, lying among the meshes of a network of delicate threads (*capillitium*), some of the latter bearing knots of calcium carbonate. The spore-containing crust (*sporangia*) may be flat or cushion-shaped; or cylindrical or globular, mounted upon a stalk. These are the more interesting to observe: from the creamy plasmodium a number of hair-like growths extend vertically, and up these creeps a portion of the cream,

arranges itself as a cylinder or a globe, and then develops the hard crust, which may be black, brown,

**Mycetozoa.** Specimens of organisms occupying a doubtful position between the animal and vegetable worlds. Top, *Trichia botrytis*. Left centre, *Brefeldia maxima*, capillitium and spores. Right centre, *Mucilago spongiosa*. Bottom, *Stemonitis fusca*, flowing plasmodium

red, or yellow according to species. Some of these are of beautiful form.

Several hundred species are known from all but the driest and coldest parts of the earth, about 200 species being British. In certain phases of their life-history they appear to be animals, in others plants. The majority of naturalists follow De Bary, who declared them to be "outside the pale of botany." See Protozoa; consult Monograph of the Mycetozoa, A. Lister, 1911.

**Mycology** (Gr. *mykēs*, fungus; *logos*, discourse). Department of botany dealing with fungi. See Fungus; Mould. For the three great divisions of the fungi see Ascomycetes; Basidiomycetes; Phycomycetes. For the drugs produced by fungi see Ergot; Penicillin.

**Mycorrhiza**. Originally structures formed by the association of the mycelium of a fungus and the root of a higher plant. Other organs were later found to have fungus associates and the meaning was extended to include all such, except when algae are concerned.

Two types of mycorrhiza are commonly distinguished: ectotrophic, in which the fungus is outside the higher plant tissues; and endotrophic, in which the fungus is to be found largely within the higher plant. The

former is the type associated with forest trees. The association probably arises as an attempt by the fungus to parasitize the tree and under unfavourable conditions the roots suffer damage. From the fact that the fructifications of certain fungi usually appear under certain trees, e.g. *Amanita muscaria* under birch; *Russula fragilis* and *Boletus badius* in pine woods, it would seem possible that they cannot be formed unless association with a suitable root has been established. Sometimes the tree may benefit from the association, as a result of the fungus passing on water, salts, and even organic matter absorbed from the soil.

Endotrophic mycorrhiza is common in herbaceous plants. Fungus hyphae occur casually in the roots of many perennial flowering plants and vascular cryptogams. They grow parasitically in the outer tissues. Deeper in, their progress seems to be arrested and branched tufts of hyphae are formed which are later digested by the host cells to leave rounded residues. With many orchids, Ericaceous plants, and prothalli of Lycopodium, to name a few examples, the mycorrhizal association is undoubtedly mutually advantageous. The fungus has access to the carbohydrates synthesised by the green plant, and it may pay for them with nitrogenous material derived from the soil or alternatively made by itself, for Phoma is known capable of fixing atmospheric nitrogen (see Nitrogen Cycle). Nevertheless the association is delicately balanced. Should the fungus be too vigorous it kills the seedlings: if the fungus is weakened as occurs in chalky soils, it dies and so, for want of it, does the host. The non-green Japanese orchid, *Gastroidea elata* exhibits dependence on *Armillaria mellea* in such an extreme manner that it can only be considered as parasitic on this fungus. The orchid has a tuberous rhizome as its only vegetative organ. This produces new tubers at the ends of its branches. When isolated from the fungus the orchid fails to flower, its new tubers are successively smaller until too weak to produce a new crop, and the plant dies.

Sir Hugh Myddelton, English capitalist

**Myddelton**, SIR HUGH (c.1560-1631). English capit-

alist. Born at Galch Hill, Denbigh, he came to London and became a goldsmith and banker in Basinghall Street. Profitable ventures in the New World enabled him to contract with the corporation of London for making a river to supply the city with water from Ware, 1609. This he successfully executed, but nearly ruined himself in the undertaking. The New River was opened in 1613, and Myddelton was made a baronet in 1622. M.P. for his native county 1603-28, he died Dec. 10, 1631.

**Mydriatics.** Drugs causing the pupil of the eye to dilate. Those most often used are atropine and homatropine. Drugs which contract the pupil are called myotics.

**Myelitis** (Gr. *myelos*, marrow). Inflammation of the spinal cord. Acute myelitis may be due to exposure to cold and wet, fracture or injury of the spine, or may be a complication of severe infectious diseases, such as typhus and smallpox. The condition may also arise from extension of disease of the vertebrae, such as caries, or occur in the course of syphilis. The onset of acute diffuse myelitis may be marked by rigors and rise of temperature. Paralysis rapidly develops, first in the legs, and in the arms, if the upper part of the cord becomes involved. The muscles waste rapidly, and delirium and high fever terminate in death. In the variety of the disease known as poliomyelitis (infantile paralysis), nerve cells in the grey matter of the cord are destroyed. Treatment resembles that for meningitis (*q.v.*). When the condition is chronic, massage and electricity may improve the tone of muscles.

**Myers, CHARLES SAMUEL** (1873-1946). British psychologist. Born March 13, 1873, he attended the City of London school; Caius College, Cambridge; and St. Bartholomew's hospital. During 1906-09 he was professor of psychology at King's College, London. It is largely due to Myers's insistence that the study of individual psychology is recognized as important in the smooth conduct of businesses and the armed forces. He was consulting psychologist to British armies in France during the First Great War; and when the committee on personnel selection was set up by the War office in the Second Great War he was at once appointed. Created C.B.E. in 1919, Myers died Oct. 12, 1946. He wrote *Business Rationalisation*, 1932; *A Psychologist's Point of View*, 1933; *Shell Shock* in France, 1914-18, 1940.

**Myers, FREDERIC WILLIAM HENRY** (1843-1901). British man of letters. He was born, Feb. 6, 1843, at Keswick, and educated at Cheltenham and Trinity, Cambridge. In 1872 he became an inspector of schools. Of his poems *The Renewal of Youth*, 1882, is probably his finest effort. Later he became interested in spiritualistic phenomena, and was an original member of the Society for Psychical Research. The results of his psychic studies are embodied notably in *Human Personality and its Survival of Bodily Death*, 1903. Myers died in Rome, Jan. 17, 1901. Before he died he agreed to make every effort to communicate with friends after death, and it is claimed that he did so.

**Myingyan.** Dist. and town of Burma, in the Meiktila division. The dist. is situated on the left bank within the curve of the Irawadi and N.E. of the Pegu Mts. Oilseeds are the chief crop. The town is a rly. terminus on the left bank of the Irawadi. In Japanese occupation since 1942. Myingyan was recaptured March 22, 1945, during the operations which cleared the Meiktila area. Area of dist., 3,107 sq. m. Pop. dist., 539,057; town, 28,700.

**Myitkyina.** District and town of the Kachin state, Burma. The town is situated on the upper Irawadi more than 250 m. N.N.E. of Mandalay, with which it is connected by rly., being a terminus on the right bank of the Irawadi, of which it is the limit of navigation. Myitkyina was occupied by Japanese forces on May 8, 1942, after its evacuation by Chinese troops. On May 17, 1944, American and Chinese troops, seized Myitkyina airfield and part of the town, but withdrew in the night from the latter. Although isolated, the Japanese in Myitkyina held out until Aug. 4. By the fall of Myitkyina the invaders lost their last important base in Upper Burma. Area of dist., 10,977 sq. m. Pop. dist., 298,323; town, 20,000. *Pron.* Mitchi-nah.

**Myllita.** Goddess of Babylonian mythology, associated with love and fruitfulness. Herodotus records that her worship claimed special rites from every woman at some time in her life.

**Mylius Erichsen Land.** That part of N. Greenland lying S. of Heilprin Land, E. of Peary Land, and bounded N. and E. by Wandel Bay and Denmark Fjord, in lat. 80° to 82° N. It was named after the Danish explorer who penetrated here in 1906.

**Mylonite.** In geology, a rock which has been crushed by earth movements so as to lose its original structure. Intense crushing may have resulted in the mylonite becoming fused by heat. Typical examples are found on the Moine Thrust (*q.v.*) in N.W. Scotland.

**Mymensingh, MAIMANSINGH, OR NASTIRABAD.** Town in the Mymensingh dist. of E. Bengal, Pakistan. On the right bank of the old channel of the Brahmaputra, it is a centre for traffic on the river in rice and jute. It has connexion by rly. with Dacca and Chittagong. Pop. 22,000.

**Mynn, ALFRED** (1807-61). English cricketer. Born at Goudhurst, Kent, Jan. 19, 1807, he joined the

Alfred Mynn,  
English cricketer

Harrietsham cricket club in 1825. He played at Lord's in 1832, and became one of the chief performers in the country. A stalwart of the Gentlemen, he helped in their victories over

the Players between 1840-50, and played regularly for Kent almost up to his death on Nov. 1, 1861. As a fast round-arm bowler Mynn had no equal.

**Mynyddislwyn.** Urban dist. of Monmouthshire, England. It is 8 m. S.W. of Pontypool, and stands on the coalfield, its industries including the making of furniture and electric switch gear. There are quarries in the neighbourhood. Pop. 15,000.

**Myocarditis** (Gr. *mys*, muscle; *kardia*, heart). Inflammation of the muscle substance of the heart associated with rheumatism, influenza, and fevers. *See* Heart.

**Myopia** (Gr. *myops*, short sighted). Short sight. It is an error of refraction most commonly due to abnormal elongation of the eyeball, with the result that parallel rays are brought to focus in front of the retina, and vision is accordingly indistinct. Only divergent rays are focused on the retina, and in consequence short-sighted persons find it necessary to hold an object closer to the eye than do normal persons. The error of refraction can be adjusted by wearing specially corrected spectacles or contact lenses fitted to bear directly against the eyeball. *See* Eye.

**Myosin.** Proteid produced by muscle plasma after death. The plasma separates into a serum and

a clot, the latter being myosin. It is this occurrence in the muscles of the body after death that causes the phenomenon known as rigor mortis (*q.v.*). Myosin is contained in brine used for pickling meat, and prepared from flesh after removing albuminoids.

**Myriapoda.** Class of the Arthropoda, which includes the centipedes and millipedes. They have long, segmented, cylindrical, or flattened bodies, and each segment is provided with paired limbs. The animals are noted for the great number of their legs. A great number of species are distributed over the tropical and temperate regions of the world. Great Britain has several, all small and harmless.

### Myricaceae.

Small family of shrubs and trees. Natives of Europe, Asia, S. Africa, and N. America, they have alternate and undivided leaves, often covered with a wax-secreting down. The male and female flowers are distinct, in separate spikes, and without sepals or petals; the males consisting merely of stamens, and the females of the one-celled ovary and two thread-like styles. The fruit is compressed on two sides, and contains a single-seeded stone. The species yield fragrant wax, benzoic acid, and tannin. See Sweet Gale.

**Myrmidons.** In Greek legend, the Thessalian tribe of which Achilles was king. Achilles brought them to Troy, and withdrew them from the fighting when he quarrelled with Agamemnon. Their unqualified devotion to Achilles has caused the term myrmidon to express unquestioning obedience.

**Myrobalan** (*Phyllanthus emblica*). A tree of the family Euphorbiaceae, a native of India and Malaya. Its alternate leaves are slender and arranged in two ranks along the twigs. The small green flowers have the sexes separate and are clustered. The small, acid, fleshy fruit contains a hard nut with six seeds. Fruits are eaten raw, or preserved with sugar as a sweetmeat, while bark is used in tanning and dyeing. The wood is hard and damp-resisting.

Myrobalan Plum. Spray of foliage and fruit. Inset, single flowers

**Myrobalan Plum or CHERRY PLUM** (*Prunus cerasifera*). Shrub of the family Rosaceae. Its native region is uncertain, but is probably the Caucasus. The branches are not spiny; the leaves are elliptical, the flowers white, and the fruit round and red, with yellow flesh. This shrub is much used for making hedges.

**Myron** (fl. 5th century B.C.). Greek sculptor. Born at Eleutherae in Boeotia, he was a pupil of Ageladas of Argos. Specially known as a worker in bronze, he chose for subjects athletes and animals. His chief characteristics were truthfulness to nature, and active rather than passive representation. His most famous works were the Discobolus, Ladas the Runner, a Satyr (probably Marsyas), and a bronze cow. The last was remarkable for epigrams inscribed upon the animal's body after the manner of the so-called statue of Pasquino at Rome. See Discobolus illus.; Greek Art; Pasquinade.

**Myrrh.** Gum resin obtained from the stem of *Commiphora myrrha*. This is a small tree with whitish-grey bark, from which the myrrh escapes in yellow oily drops, darkening in colour as they harden. The main sources of myrrh are Somaliland and Arabia, where it is gathered by natives and placed in goatskins which are brought down to the coast for shipment. The gum resin consists of a mixture of resin, gum, and from 3 to 8 p.c. of a volatile oil. The most important

medical use of myrrh today is as an aromatic stimulant mouthwash.

Myrrh was used in the East as a perfume and for embalming. It was one of the gifts made by the magi to the child Jesus Christ, and on this account the custom exists of offering gold, frankincense, and myrrh every year on the feast of the Epiphany. The offering is made on behalf of the British sovereign in the Chapel Royal, London. See Frankincense; Magi. *Pron. mer.*

**Myrtaceae.** Family of trees and shrubs, mostly natives of the tropical regions. They have undivided leaves, and flowers with four- or five-parted calyx and four or five petals. This vast family includes over 90 genera and about 2,800 species. Among well-known genera are *Eucalyptus* and *Myrtus*, of which the well-known myrtle (*M. communis*) of S. Europe serves as a type.

**Myrtle** (*Myrtus communis*). Evergreen shrub of the above family Myrtaceae, native of W. Asia, but long naturalised in S. Europe, whence it was introduced to Great Britain in 1597. It grows to a height of 10 ft., has shining oval opposite leaves, and fragrant white flowers largely used in perfumery. The purple berries also are fragrant; they are sweet and have a strong aromatic flavour. In the extreme S. of England the myrtle is hardy and can be grown out of doors; elsewhere it needs protection in winter. It may be grown from seeds or cuttings, taken in early summer, and grown in a compost of sandy loam and leaf-mould. Myrtle wreaths were used among the ancients to crown the victors in athletic games.

**Mysia.** Ancient country of Asia Minor. Lying between the Aegean Sea, Propontis, Bithynia, and Lydia, it sometimes included the Troad.

The Mysi first appear in history when Mysia came under Croesus, king of Lydia, in the 6th century B.C. With the overthrow of the latter by the Persians, Mysia became part of the Persian empire, and after the death of Alexander the Great in 323 B.C., part of the kingdom of Syria. In 133 the country became part of the Roman empire.

**Mysore.** Indian state. It is roughly a triangle on the Deccan plateau, with Bombay on the N.W., Coorg on the S.W., and Madras on

Myrtle. Foliage and flower spray of the evergreen shrub

other sides. On the average 2,000 ft. alt., high hills, called droogs, rise in isolation from the plain; a ridge across the middle of the state separates the drainage of the Kistna from that of the Cauvery. Much land is irrigated from the Cauvery; the chief crop is ragi, a native millet; other crops are cotton, sugar cane, and rice. Gold is mined at Kolar and manganese in Shimoga; the gold output has been valued at over £2,000,000 a year, and industry has been advanced by hydro-electric installations. Mysore city is the capital, but Bangalore is a more populous town. There is splendid scenery and a healthy climate.

From 1760 to 1799 the state was ruled by a Mahomedan usurper, Haider Ali and his son Tippoo. The British restored the former Hindu dynasty in 1799, took over the administration 1831-81, and set up a Hindu maharaja. Efficient administration has gained for Mysore the name of the model state. At the partition of 1947 it acceded to India. Area 29,458 sq. m. Pop. 7,329,140. See Madras.

**Mysore.** Capital of Mysore state. It is situated near the Cauvery, 100 m. S.W. of Bangalore, with which it is connected by rly. There are numerous modern buildings, including the Victoria jubilee institute and the palace of the maharaja. S.E. of the city is temple-crowned Chamundi Hill, 3,489 ft., with a colossal recumbent figure of the sacred bull Nandi. The city was the capital from early times until 1610. It was then superseded by Seringapatam until 1799, when the court again moved to Mysore. Pop. 150,540.

**Mystagogue.** Official charged with important duties in the celebration of the Eleusinian mysteries (*q.v.*). These *mystagogoi* were licensed by the state.

**Mystery** (Gr. *initiation*). Secret rite. The Greek word *mysteria* denoted rites performed in the presence of persons prepared by gradual initiation, under a bond of secrecy. They probably grew out of primitive ceremonial dances associated with the pre-Hellenic

nature-worship of Thrace. Their chief centre was at Eleusis (*q.v.*).

A second group, perhaps Pelasgian, seems to have spread from Thrace to Lemnos and Boeotian Thebes. These mysteries were concerned with the deified shades called Cabiri, and included the ritual slaying of an animal victim. At Andania in Messenia the mysteries combined the veneration of Demeter with that of the Cabiri. These Cabirian rituals were often confused with two others, those of the Cretan Curetes, which were essentially puberty rites, and those of the Phrygian Corybantes, which were ceremonial dances symbolising death and burial as magical incentives to fertility.

A third group was concerned with Orpheus, himself perhaps of Thracian birth. With his veneration Greece associated the refinements of melody and poetry. In these Orphic mysteries the

with those of the Persian Mithras. All of them were for centuries engaged in a life-and-death struggle with the Christian faith.

In the N.T. the word *mystery*, as used by S. Paul, denoted the Divine plan, and there is reason to doubt whether the apostle referred directly to, or was personally familiar with, any of the mystery-

idea of recurrent death and resurrection was symbolised, Orpheus himself being in some degree considered as the founder and origin of all mysteries: and the ritual phenomena bore relationships to those which centred about the Egyptian worship of Isis and Serapis, and the Phrygian worship of Attis and Cybele. At the beginning of our era these mysteries were practised throughout the Greco-Roman world by the private members of secret societies, side by side

religions of his time. In a later age the early Fathers began to draw comparisons between Christian and pagan mysteries. But the resemblances with Christian practice observable in the later forms of the oriental cults prevalent in the Roman world, notably those of Isis and Mithras, are mainly explicable as imitations and not precursors of Christian institutions.

The religious mysteries already discussed are a special development of a social institution of widespread occurrence, and arose out of the emotional life of settled agricultural peoples. The main elements—purification, offering, procession, song, dance, drama, secret formula, and mechanical accessories—are so universal that these rituals must be deemed to have their roots in Neolithic culture. They sometimes occur as modes of admission into general society, as with primitive puberty-rites, and sometimes as devices for securing the local or specialised interests of artificial social groups. Thus the daubing of initiates with clay, characteristic of some Greek mysteries, is still practised in W. Africa, Guiana, Australia, Melanesia, and the Andamans, while the scope of the mystic bull-roarer (*q.v.*) is wider still. See Eleusinia;

Freemasonry; Initiation; consult St. Paul and the Mystery-Religions, H. A. A. Kennedy, 1913.

**Mystery of Edwin Drood.** THE. Unfinished novel by Charles Dickens. It was to have been published first in twelve monthly parts, illustrated by S. Luke Fildes, but the author died, June 9, 1870, before completing the writing of the sixth part. The fragment was published in book form the same year, and is usually included in collected editions of the author's works, especially as it contains some of his most powerful and mature descriptive writing. So far as it stands, the story concerns the disappearance of young Edwin Drood, presumably murdered by his uncle John Jasper. Most of the action takes place in and near the cathedral precincts of Rochester, thinly disguised as Cloisterham, and the cathedral crypt and tower both appear to have been intended to figure prominently in the completed plot. Other scenes are laid in Staple Inn, London, and in an East-end opium den. The question of how the story was to end has aroused continuous controversy, and there are many opposing theories (see Drood Controversy). There have been several attempts to complete the book, also more than one stage version, notably that by J. Comyns Carr, presented by Tree in 1908. A film version (American) was shown in 1935.

**Mystery Play.** Type of religious drama in medieval Europe. It was so called either as representing mysteries of the faith, or more probably as being a ministry or craft. Medieval plays with biblical subjects are commonly called mysteries. The medieval drama was evolved from religious ritual. To the recitation of sacred narratives and antiphonal singing were added at the great church festivals quasi-dramatic dialogues and symbolical acts. By the 12th century the clergy and choirs performed dramas in French churches.

From the churches the dramas were transferred to the churchyards and to open spaces in towns, and when in 1210 the clergy were forbidden to act except in churches the performances were given by laymen. A great impetus was given to the movement by the institution in 1311 of the Corpus Christi festival on the Thursday after Trinity. The guilds in English and continental towns collaborated in producing cycles of plays representing sacred events from the

Creation to Doomsday. Comic relief was provided by Noah's wife, the shepherds of Bethlehem, and other stock characters.

Of the extant English cycles, the oldest are those of Chester (24 plays) and York (48), dating from about 1350. The 32 so-called Towneley mysteries were probably acted at or near Wakefield. The 42 Coventry plays seem to have been written for monks or friars. Some mystery plays in the Cornish language are also preserved. The religious drama lingered in England until the end of the 16th century.

In many continental countries examples of mystery plays abound. In Paris the representations were restricted to the confraternity of the Passion. The Scandinavian reformers encouraged the art, which was widely practised in Germany until its prohibition by the archbishop of Salzburg in 1779 was followed by that of other prelates of the empire, the inhabitants of Oberammergau alone obtaining permission to perform a passion play. Similar dramas are still acted in Spain, and at Bruges and Furnes in Belgium. See Drama; Miracle Play; Oberammergau.

**Mysticism** (Gr. *myein*, to close the eyes). Term originally used in connexion with the Greek mysteries. A mystic was one who had been initiated into the esoteric knowledge of divine things which the mysteries imparted to their converts. The word is now used in different senses, but in its technical meaning has been defined by Dean Inge as "the attempt to realize the presence of the living God in the soul and in nature, or more generally as the attempt to realize in thought and feeling the immanence of the temporal in the eternal and the eternal in the temporal." All mystics claim the power of immediate approach to God without the aid of external means.

Traces of mysticism are to be found in most religions. The spirit of mysticism has left its mark upon the Upanishads and the Hindu philosophical schools. In Islam it appears in Sufism. In Greece its origin may be traced to Plato, though its development was due to oriental influences connected with the Greek mysteries; it reached its climax in Neo-Platonism, especially in the writings of Plotinus.

Christianity has always been a favourable soil for the growth of mysticism. There are mystic elements in the N.T., particularly in the Johannine and Pauline litera-

ture. It was not, however, till the 5th century that the movement assumed large proportions. The writings of Pseudo-Dionysius are an attempt to transform Christianity under the influence of Neo-Platonism into mysticism pure and simple, and exercised a remarkable influence on Christian thought for several centuries.

The golden age of Christian mysticism falls within the period 1250-1500. It originated in a Pantheistic society which flourished in the 13th and 14th centuries, known as The Brethren of the Free Spirit. The watchword of this society was "All that is is God"; man and God were therefore always in intimate association: in fact, it was hardly possible to distinguish between them. Out of this society came Meister Eckhart (1260-1329) one of the most remarkable of the German mystics. Eckhart's creed is pronouncedly pantheistic. "God is not the highest being," he says, for "he is the only being. Outside of God there is nothing but illusion and deception." Gradually mysticism separated itself from pantheism owing largely to the influence of John Ruysbroek (1293-1381), who has been called "the patriarch of the German mystics."

But the most influential mystic was John Tauler (1290-1361), who succeeded in severing mysticism from all its pantheistic connexions, and bringing it into line with orthodox Christianity. Hitherto mysticism had been largely contemplative, and had shunned the practical life. Tauler showed that it was worthless unless it issued in consecration of character and life. Two societies were founded in Germany to popularise mysticism: (1) The Friends of God; (2) The Brethren of the Common Lot; both instrumental in preparing the way for the Reformation.

Thomas à Kempis was connected with the latter society, and though the Imitatio Christi cannot perhaps be called mystical in the technical sense of the term, it was written under the spell of the teaching of the mystics. Another product of the same school of thought was the Theologia Germanica, a book which had a unique influence at the time, and did almost as much as the Imitatio Christi for the recovery of spiritual religion in Germany. In the 16th century there was a powerful resurgence of mysticism in Roman Catholicism, particularly in Spain. The chief leaders of the movement were

S. Teresa, S. Juan, and Molinos, who carried to completion the work of S. Catherine of Siena. S. Catherine is the heroine of Baron von Hügel's book on mysticism, and his delineation of her character is the best exposition of the part which mysticism played in the devotional life of a devout and orthodox R.C. In France, mysticism found expression in the writings of Fénelon, Bossuet, Madame Guyon, and in Jansenism.

Roman Catholicism has always been more favourable to mysticism than has Protestantism, though the latter has by no means been untouched by its spirit. Boehme was the first great Protestant representative and from his writings William Law introduced mysticism into the English Church. It cannot be said to have been a power in English life, though it found strong advocates in the Cambridge Platonists. Quakerism, with its doctrine of the Inner Light, and Methodism with its insistence on the need of personal assurance of salvation, have points of affinity with mysticism, but the movement has never gripped the soul of England.

**Mytens, DANIEL** (c. 1590–1642). Dutch painter, born at The Hague. He was influenced by

Miereveldt and Rubens, came to London, and was painter to Charles I, 1625–34. After Van Dyck's arrival he returned to Holland. His best works

Daniel Mytens,  
Dutch painter  
After Van Dyck

include Hudson, the Dwarf, with a dog in St. James's; Charles Howard, Earl of Nottingham, at Hampton Court; Charles I and Henrietta Maria, in Buckingham Palace.

**Mythology.** The sacred stories of the various peoples of the world. Of these stories some relate to the Creation, and to divine or superhuman beings, their genealogies, activities, and adventures, whether they are believed to have originated the world, or mankind, or a particular tribe, rank, or family, or to superintend or take part in its

government, to be concerned in its well-being, to be hostile to it, or to lead a life of their own more or less apart from mortals.

Other stories relate to saints or heroes who have championed mankind or conferred benefits, who have undergone sufferings, made discoveries or inventions, or moulded the earth or its inhabitants into their present form. Among such stories are included those of the origin of death, the gift of fire, the deluge, the origin of beast and bird and tree, or their peculiarities, the organization of society, and of various institutions and customs. Many stories are aetiological, i.e. are told for the purpose of explaining these and other things; many, on the other hand, simply narrate what passes with an uncultured or half-cultured people for history. They are often connected with the worship of the gods, are told to explain the festivals, the ceremonies, the forms of their images, the position and furniture of their temples. In a word, they are sacred.

#### Myths Believed True

Unlike some non-sacred tales they are told as true, and wild and repulsive or impossible as they may be, they are or were once believed as facts. Another characteristic frequently, but not universally, present is that they are told only under special conditions, or at a certain time of year, or in connexion with certain rites, or to certain classes of persons, as the initiates into a cult or mystery. The scientific collection and criticism of these stories is called the science of mythology.

Myths take their rise low down in culture. The people has not yet been discovered so savage as to be destitute of myths. As culture advances, one incident after another becomes incredible to the growing intelligence, or repugnant to the more refined manners and morality of the community, but the old stories are still piously repeated by the backward classes or the priests of the local shrines. Again, the myths deemed derogatory to the divinities are denounced as lies or are interpreted as parables.

All these methods were tried in Greece. From Theagenes of Rhegium, and Metrodorus, in the 6th century B.C., down to Porphyry, and the latest age of paganism, the interpretation of the gods as physical phenomena was a favourite teaching. The 19th century explanation that myths are a disease of language, that seeks their explanation in questionable

etymologies and blunders of meaning, was anticipated by Plato.

Ultimately Christianity was victorious over paganism throughout the Roman empire. The official theory of the conquerors was that the heathen divinities were devils, and their stories lies, or a mere parody of the facts preserved in Holy Writ. At the revival of learning the cudgels were taken up by learned men on behalf of the Greek mythology. In fact, even during the Middle Ages, when the gods of the heathen had ceased to be serious competitors for belief with the denizens of the Christian Olympus, the theory that they were devils proportionately weakened, and men reverted to the explanation that their stories were parables, an explanation exploited for the purpose of Christian instruction in the *Gesta Romanorum* and other collections of tales. Bacon in *The Wisdom of the Ancients* after the Reformation attempted to revive this method of exposition; but its difficulties were such that no two interpreters agreed on the same explanation. More recently the Euhemeristic theory has been taken up by Herbert Spencer and Grant Allen. It is relevant to observe that, if every divinity were resolved into the shade of a human being, the problem of the origin and meaning of the mythical tales told everywhere on all sorts of themes would remain as puzzling as ever.

#### Philological Basis of Myths

The adherents of another school influential in the 19th century sought the answer to the question from philology. From Germany this method of interpretation spread wherever learned men expounded philology. In England Max Müller laid down "that the best solvent of the old riddles of mythology is to be found in an etymological analysis of the names of gods and goddesses, heroes, and heroines." Accordingly, he set himself to investigate and interpret the names. Philology as a scientific study was the result of acquaintance with Sanskrit, the eldest of the family of Aryan tongues, and in the *Rigveda*, the earliest Sanskrit literature, the philological school of mythologists thought they had found the explanation of the names and activities of the Aryan gods and the meaning of Aryan mythology.

Taking the *Rigveda* as his starting-point, Max Müller tells us: "The beginning of mythology came from a poetical and philosophical conception of nature and

its most prominent phenomena: or, if poetry and philosophy combined may claim the name of religion, from a religious conception of the universe."

There are other elements taken up into it as it developed, but this is the beginning, the foundation. It is discovered by an examination of the names and epithets of the gods and of the deeds ascribed to them, and then by equating the names with names of gods and other words in the sister tongues. Many of these equations are contested; The greater number are quite uncertain.

When the *veda* was carefully examined, the myths were practicably resolvable into two: that of

and Hindu myths were phenomena common to savage myths everywhere, and that they arose out of a condition of mind known to exist everywhere among savages. Andrew Lang recognizes two elements in all mythologies—"the factor we now regard as rational, and that which we moderns regard as irrational."

The savage and the ancestors of civilized people were on a par, which means that the ancestors of civilized people were once savages, as even the Greeks admitted. They endowed all external things with their own self-consciousness. The lower animals, trees, rocks, differed from men only in shape, save that they were often

vastly stronger and cleverer. The savage knew not the bounds of this cleverness; he had no standard save imagination and fear by which to measure it. Naturally his belief extended to the grotesque and the impossible. Shape-shifting was accepted as a matter of course. The super-human personages of his imagination wore the shape of beasts, either permanently or at will.

In the lower culture everywhere many men believe themselves possessed of extraordinary powers; and all men, if

they do not believe it of themselves, believe it of some. Nay, they believe that, if not themselves magicians, at least they can by means of word and rite appropriate and exercise many extraordinary powers; they can work their will by spell or amulet. The gods and heroes are endowed with the passions of men, with the powers attributed to at all events some men; but both passions and powers are idealised and magnified indefinitely.

Not that these are the sole elements of which myths are made. They are merely the groundwork of mythology—they, and not hyperboles of poets, disease of language, misinterpretation of current expressions. Such causes play their part, but it is a small one. Other subordinate causes are distorted or imperfect recollections of facts,

the cluster of traditions about a great name, the complications of organized society, and the abiding aetiological impulse which we strive laboriously to satisfy by methodical scientific inquiry, but which in that child-like condition is stayed by a tale.

Lang's work had an immediate and profound effect. In Great Britain the philological theory of mythology was killed. The anthropological method, which explains mythology not by a disease of language, but by the universal characteristics of the mental condition of the lower culture, was accepted thenceforward by all serious students of the subject.

Rolleston, 1911; Myth and Society in Attic Drama, A. M. G. Little, 1943.

**Mytton, JOHN** (1796-1834). English sportsman and eccentric. Born Sept. 30, 1796, he was educated at Westminster, and became a cornet in the 7th Hussars in 1816. He left the army next year and devoted his life to sport, particularly racing, hunting and shooting. A man of great strength and reckless courage, he drove a tandem across country for a wager one night, negotiating a deep drain, a sunken fence, and two quickset hedges. After squandering a vast fortune, all his effects were sold by creditors, and "Squire" Mytton died in the king's bench prison, March 29, 1834.

**Myxoedema** (Gr. *myxa*, mucus; *oedema*, swelling). Disorder due to diminution, loss of function, or toxæmia, of the thyroid gland (*q.v.*); more common among women than men. The patient becomes sluggish, lethargic, with coarsening of the hair and skin, and mucoid infiltration of the subcutaneous tissues. Failure of memory and sensitivity to cold are symptoms. A cure consists in the administration of thyroid extract.

**Myzostoma.** Small worm which occurs as an external parasite on various Crinoidea (*q.v.*). It is a disk-shaped animal without any trace of external segmentation and is usually classified in a family, Myzostomidae, of the phylum Annelida.

# GREGO-ROMAN MYTHOLOGY: PRINCIPAL DEITIES

Greek Name	Roman Name	Description
Zeus	Jupiter	Chief of the gods
Hera	Juno	Chief goddess, wife of the above
Pluto	Dis	God of the underworld
Persephone	Proserpine	Queen of the underworld; also goddess of spring
Athena	Minerva	Goddess of wisdom
Apollon	Apollo	Sun god; also god of music and poetry
Artemis	Diana	Moon goddess; also goddess of the chase
Ares	Mars	God of war
Poseidon	Neptune	God of the sea
Hephaistos	Vulcan	Fire god
Aphrodite	Venus	Goddess of love and beauty
Demeter	Ceres	Goddess of the earth or harvest
Hestia	Vesta	Goddess of home
Hermes	Mercury	Messenger of the gods
Eros	Cupid	Boy god of love
Dionysus	Bacchus	God of wine
Chronos	Saturn	God of time
Eos	Aurora	Dawn goddess
Pan	Faunus	God of flocks and herds

## SCANDINAVIAN AND SAXON MYTHOLOGY

The chief Scandinavian gods were the Mysterious Three, led by *Har* (the mighty); the *Aesir*, led by *Odin*; and the *Vanir*, led by *Njord*. The chief Saxon gods were *Odin*, or *Woden*, and *Frea*, corresponding in status to *Jupiter* and *Juno*; *Hertha*, goddess of the earth; *Tiw*, from whom Tuesday is named; and *Thor*, god of war.

the conquest of the darkness of night, and that of the breaking of the prison of the rain.

But the time came when people could no longer accept the dogmatism of the philologists. It became incredible that the gods of the Aryan-speaking nations (and they were the only ones the philologists seriously attempted to explain) were due to "a disease of language," and one of the things that made it incredible was the wearisome monotony of the results.

Insurrection broke out first in Germany, while in Great Britain the researches and example of Tylor, Avebury, and MacLennan had prepared the way. Andrew Lang declared war in a number of essays, culminating in *Myth, Ritual and Religion*, 1887. He proved that the irrationalities of Greek

THE ancient Egyptian hieroglyph corresponding to the letter N, resembled a water-line , which in the hieratic form (3000-2500 B.C.) was at once formalised and simplified thus:  The resemblance of this character to an ash was close enough for the Phoenicians and Hebrews, adopting the letter in their own alphabets to give it the Hebrew name for fish, which is *nun*, whence our name for the letter is directly derived. In carving the letter, however, they tended to lengthen the upward and downward strokes at the extrem

ities at the expense of the horizontal:  The earliest Greek form:  and the early Latin  reveal clear stages between the earliest and final forms. The classic Roman had the central diagonal thick and the two uprights thin, this being the natural result from the use of the broad-pointed pen, which inscribed the letter in three strokes, up, down, up. But for informal writing the speedier method was used of starting and ending with downward strokes, as in the minuscule, now represented by the familiar small n of the printer

**N** Fourteenth letter of the English and Latin alphabets, one of the nasal consonants. In the combination *ng* it has a marked nasal sound in words like *king*, *sing*, to some extent comparable with the sound heard in the French *mon*, *non*. Otherwise it is pronounced as in *can*, *neck*. It is mute at the end of words after *m*, as in *column*, *hymn*, *solemn*. See Alphabet: Phonetics.

**Naafi.** Popular abbreviation for the Navy, Army, and Air Force Institutes. The work of the organization is described under Canteen. *Pron.* Naffy.

**Naaman.** Biblical character. A distinguished Syrian general, he was cured of leprosy by following the advice of the prophet Elisha and thereupon adopted the Jewish religion (2 Kings 5).

**Naas.** Urban dist. and market town of Kildare, Eire. It is served by Eire state rlys. and the Grand Canal. It stands near the Liffey, 20 m. S.W. of Dublin. Supposed to have been the capital of the kings of Leinster until after the English conquest it had

Naas arms

a castle and an abbey, and it was represented in the Irish parliament till 1800. Near is Punchestown (*q.v.*), which holds an annual steeplechase meeting. Market days, Mon. and Thurs. Pop. 3,774. *Pron.* Nace.

**Näås.** Village of Sweden, in the län or govt. of Göteborg, 20 m. by rly. N.E. of the seaport of Gothenburg. It is the seat of the Abrahamson school of handicrafts.

**Nabeul.** City in the N.E. of Tunisia, renowned for its manufacture of perfumes and essences. It is situated on the Gulf of Hammamet in a fertile district producing oranges, lemons, and flowers, grown for European markets. There is a rly. to Tunis.

**Nabha.** Tn. and former Phulkian state of Patiala and E. Punjab union, India. The area has

an annual rainfall of 18 ins. and grows food grains. In 1928 the ruling chief was deposed and succeeded by a son aged 10. Nabha town was founded in 1755 by Hamir Singh. Since irrigation has been in use from the Sirhind Canal the soil has become waterlogged and the town unhealthy. Area 947 sq. m. Pop. state, 340,044: town, 19,040.

**Nablus** or **NABLOOS.** Town of Palestine, 28 m. N. of Jerusalem. As Shechem, it is frequently mentioned in the O.T. Abimelech, the son of Gideon, destroyed the city; later it was rebuilt, and became the capital of Jeroboam, but was eventually deserted. Vespasian built a new town on the site, and called it Flavia Neapolis, the modern title being a corruption of the second word. According to tradition Jacob was buried in Shechem, and Jacob's Well is shown near Gerizim. It was a holy city of the Samaritans, and the birthplace of Justin Martyr. During the First Great War the Turks, after their surrender of Jerusalem, fortified Nablus as a military base. In Sept., 1918, it was taken by British troops under Allenby. Pop. 23,250.

**Nabob.** Title given to the Great Mogul's viceroys, and generally to native rulers and persons of rank in India. In the 18th century nabob was used in England of one who ostentatiously spent a fortune made in the East. It is a corruption of the Hindustani *nawab*.

**Nabonidus.** Last independent king of Babylon. A usurper of priestly descent, he devoted himself to temple restoration and research. Government was left to his son Belshazzar (*q.v.*). The life of Nabonidus was spared when Babylon fell to Cyrus of Persia. 538 B.C. See Babylonians.

**Naboth.** Jezreelite who owned a vineyard adjoining the palace of Ahab. When he refused to part with it, Jezebel secured it by causing Naboth and his sons to be executed on a false charge of blasphemy (1 Kings 21). See Ahab.

**Nacelle.** Aeronautical term for the engine housings of a multi-engine aircraft. They are usually situated in the leading edges of the wings. Formerly the term was used for the whole aircraft body.

**Nachtigal, Gustav** (1834-85). German explorer. Born Feb. 23, 1834, at Eichstedt, he qualified in medicine at Halle, and in 1869 was sent on a mission to the sultan of Bornu. Thence he explored Lake Chad and the Shari river, traversed Wadai, and made his way back to Cairo in 1874. Ten years later he was sent by the German govt. to the W. coast of Africa and explored those parts of Togoland and Cameroons which were eventually annexed by Germany. He died April 20, 1885.

**Nadia** or **NABADWIP.** Dist. and town of W. Bengal, India. The dist. is a part of the Ganges delta, and the govt. maintains channels for steamer navigation in the Bhagirathi, Bhairab, Jalangi, and Matlabhanga rivers. Rice and jute are grown. The town is on the Bhagirathi or Upper Hooghli, 55 m. N. of Calcutta. Area 2,879 sq. m. Pop. dist., 1,759,846; town, 20,983.

**Nadiad.** Town of India in Kaira dist., Bombay state. It is a rly. junction on the line from Baroda to Ahmadabad. There is considerable trade in tobacco and ghi. A cotton mill provides some employment. Pop. 46,510.

**Nadir.** In astronomy, the point of the celestial sphere directly beneath the observer, i.e. exactly opposite to the zenith (*q.v.*).

**Nadir** (1688-1747). Shah of Persia. He was born in Khorassan and at the age of 17 he was captured by the Uzbek Tartars, escaping after four years' captivity. After many wild adventures, he entered the service of Tahmasp II, shah of Persia, in 1726 and deposed him in 1732, proclaiming himself regent for the minor Abbas III. He carried out successful campaigns against the Russians and Turks, and on the death of Abbas, 1736, seized the Persian throne. Victorious against Afghanistan and

Bokhara, he invaded India, attacked the Great Mogul, seized Delhi in 1739, carried away the Koh-i-Nor diamond and the Peacock throne, and put over 30,000 of the inhabitants to the sword. He was assassinated at Pethabad, June 19-20, 1747.

**Nadir Shah** (1830-1933). King of Afghanistan. Born April 10 1880, his full name being Mohammed Nadir Shah Ghazi, he defeated Habibullah in 1929, being proclaimed king, Oct. 16. He travelled extensively in Europe and endeavoured to introduce Western ideas into his country, but his attempts to effect national unity and modernise Afghanistan were cut short by his assassination, Nov. 8, 1933.

**Nadson, SEMION YAKOVLEVITCH** (1862-36). Russian poet. Born in St. Petersburg, of Jewish birth, at the age of 20 he published a volume of poems, which met with great popular success. In 1884 he joined a St. Petersburg weekly paper, but died two years later.

**Naegli, KARL WILHELM VON** (1817-91). Swiss botanist. He was born Mar. 26, 1817, and studied botany at Geneva and Zurich. He became professor of botany at Freiburg in 1852 and Munich in 1858. Specializing in the microscopic study of plants, he made many important discoveries, notably that of protoplasm and of the spermatozooids and antheridia of ferns. He died May 10, 1891.

**Naevius** (c. 269-204 B.C.). Roman dramatist and poet. A native of Campania, he was the predecessor of Ennius and an older contemporary of Plautus. He fought in the first Punic War, and afterwards settled in Rome. He persistently attacked the aristocracy, especially the Metelli, by whom he was banished to Utica, where he died. He was the author of tragedies and comedies, and of the first Roman epic poem, written in the old Saturnian metre, the subject being the Punic Wars.

**Naevus** (Lat., mole). Lesion of the skin often present at birth, due to an over-growth of the blood vessels of the skin causing the condition known popularly as port wine mark or strawberry mark. If they are small in area treatment is by carbon dioxide or electrolysis; if large in area, by skin grafting. Other types of mole may develop in later life and may need surgical treatment.

**Nafud.** Desert of Arabia. Situated in Nejd, it extends some

400 m. from W. to E. and has an average width of 200 m. Almost waterless, it is rich in pasture in any season of normal winter rainfall, the Beduins visiting it in the spring to graze their camels and flocks. It has a general altitude of almost 3,000 ft., and one of its most striking features is the pits found amongst the sand dunes. Their floor is generally of hard bare soil, and the steep walls are of pure sand, the largest being 330 ft. deep and  $1\frac{1}{2}$  m. wide.

**Naga.** Tribes of Indonesian stock occupying the hill ranges of E. Assam. They numbered in 1911 220,034, speaking diverse Tibeto-Burman dialects. The head-hunting warrior is distinguished by cowry ornaments with human hair and tattooing. Cane girdles and anklets are also worn. Eighteen British expeditions, 1832-87, were required for the subjugation of the tribes.

**Nagada.** Town of Egypt. It stands on the left bank of the Nile, 16 m. below Luxor, Upper Egypt. Between it and Ballas 3,000 graves and two towns were excavated in 1894. The pottery, with paintings of gazelles, ostriches, and river-boats, was associated with bone harpoons, flint implements and other neolithic remains. In 1897 de Morgan unearthed what is claimed to be the tomb of Mena, who founded the 1st dynasty.

**Naga Hills.** District of Assam, India. It is occupied by the Naga tribe, and comprises a section of the mountainous tracts on the borders of Burma. Manipur lies to the S.; very little of the area is cultivated. Its area is 4,239 sq. m. Pop. 189,641.

The Naga Hills were the scene of violent fighting between Japanese and British forces in 1943. See Burma Campaign, 1941-45.

**Nagana.** A disease occurring over large areas of Africa, often fatal to domesticated animals. These districts were known as "fly belts," because of the disease being associated with the Tsetse Fly (*q.v.*).

**Nagano.** Town of Japan, in Honshu. It is situated towards the W. side of the island, near the confluence of the Sogawa and the Shinanogawa. It is the capital of a prefecture famed for its sericulture and forestry. The town was formerly called Zenkoji, from the Buddhist temple which stands on an elevation in the city. The monastery dates from 664, but the buildings are modern; the chief images are reputed to have been

made by Buddha himself. The town is on the rly. from Tokyo to the W. coast. Pop. 43,000.

**Nagasaki.** Seaport of Japan, on Kyushu island. It stood on a fine natural harbour on the W. side of the island, 3 m. from the open sea. It held the monopoly of European trade from the 16th century until 1859, when Japan was opened to foreign trade and towns more centrally situated superseded Nagasaki. The port had connexion by rly. and sea with other Japanese ports. Coal is mined in the neighbourhood. There were coke and briquette factories, ironworks and dockyards. It traded in coal, cotton, rice, sugar and camphor.

On Aug. 9, 1945, the second atomic bomb was dropped on the city by a U.S. aircraft, the first having devastated Hiroshima (*q.v.*) three days earlier. The centre of destruction was the industrial area in the Urakami valley, which was obliterated. The harbour and commercial area, nearly two miles distant, escaped with only minor damage. It was announced that 73,884 people were killed and 76,796 injured. See Atomic Bomb.

**Nagina.** Town of India, in the Bijnor dist. of Uttar union. It is situated near the middle of the dist. on the rly. from Moradabad to Dehra. It manufactures cotton, cloth, and glass, and is noted for ebony carving. Pop. 26,077.

**Nagorno Karabakh.** Autonomous province of the Azerbaijan S.S.R. Situated in Transcaucasia, it is in the S.W. of the republic. The capital is Stepanakert.

**Nagoya.** City of Japan, in Honshu. It is in the S. of the fertile plain of Mino and Owari, and owes its importance to the Shogun stronghold built in 1610. S. of the city is Nagoya harbour, on the bay of Ise. Silk and cotton, threads and fabrics are important manufactures, and the city was a pioneer in the clock industry. Atsuta Jingu is the second greatest Shinto shrine in Japan. Almost half-way between Tokyo and Osaka, the city has rly. connexion with these centres and those on the W. coast. Nagoya was bombed by U.S. aircraft on April 18, 1942, and on several occasions in 1944 and 1945. Troops of the U.S. 6th army occupied the town after Japan's surrender in Aug., 1945. Pop. 483,000.

**Nagpur.** Division and district of the Madhya union, India. The division consists of the Nagpur plain, sloping gently S. from the Satpura ranges and drained by the

Wainganga and Wardha, to the Prahita and Godavari. The dist. has a rainfall of 46 ins. Only a third of the land under cultivation is devoted to food grains, mainly wheat, most of the remainder being under cotton. Area, div., 27,294 sq. m.; dist., 3,836 sq. m. Pop. div., 3,924,985; dist., 1,059,989.

**Nagpur.** Capital of the Madhya union, India, formerly the Maratha capital of the Bonsla rajas. It occupies a central position between the Wardha and Wainganga rivers, in close relation to the great cotton-growing area of the Deccan. The importance of the town increased when the direct line from Bombay to Calcutta was made through it. It has several educational institutions, including the Morris College. Pop. 301,957.

**Nagy.** Magyar word for great. Formerly incorporated in the place names of many towns in the Austro-Hungarian empire, it has been dropped from some of them since their incorporation in other countries, e.g. Nagyikinda, Yugoslavia, became Kikinda, Nagyszombat, Czechoslovakia, became Trnava, and Nagyvarad, Rumania, became Oradea.

**Nagykanizsa.** Town of Hungary. It is situated to the S.W. of Lake Balaton on the main line rly. from Budapest, 143 m. to the N.E., to Trieste with a branch through Odenburg (Sopron) to Vienna. There are distilleries and tile works. Pop. 30,936.

**Nagykaroly.** Town of Rumania formerly in Hungary. The Rumanian form of the name is Careii Mari. It is 185 m. E.N.E. of Budapest, on the main line to Ruthenia, with a branch rly. connexion to the main towns of Transylvania. There are sawmills and textile factories. Pop. 16,000.

**Nagykörös.** Town of Hungary in the co. of Pest-Pilis-Solt-Kiskun. It is 56 m. by rly. S.E. of Budapest on the main line to Szeged, 10 m. N.N.E. of Kecskemét. Wheat, maize, and melons are grown, and cattle are reared. Pop. 28,600.

**Nahan.** Alternative name for Sirmoor (*q.v.*), former Indian state now in the Himachal union; also the name of the capital town.

**Nahas Pasha, MUSTAFA EL** (b. 1876). Egyptian politician. Educated at Cairo, he entered the legal profession, becoming a judge of the local courts. Turning his attention to politics, he became a member of the house of deputies in 1924, being president 1927-28. In 1927 he became chairman of the Wafd party, the leading nationalist party until the split in 1938,

and was notoriously anti-British. He was prime minister in 1928, 1930, 1936-37, 1942-44 (when he was also foreign minister), and from 1950.

**Nahe.** River of Germany. A left bank tributary of the Rhine, it rises near Selbach in Birkenfeld and joins the main stream at Bingen. Its length is about 60 m., much of its course being between vine-clad hillsides, the picturesque scenery of which attracts large numbers of tourists.

**Nahua.** Collective name for American Indian tribes which dominated Anahuac, the Mexican tableland at the time of the Spanish conquest. Their language was called Nahuatl. They dwelt in scattered pueblos, whose rivalry led to the formation of confederacies, whereof the Aztec finally secured the hegemony. Their descendants, called Mexicano, number probably about 500,000.

**Nahuel-Huapi** OR **TIGER LAKE.** Large lake of Argentina, in the territory of Neuquen, bordering that of Rio Negro. Situated in the Andes, at an alt. of 2,000 ft., it is 75 m. in length and 10 m. in breadth, with an area of 110 sq. m., and contains many islands. It is the source of the river Limay, the boundary of the territories of Neuquen and Rio Negro.

**Nahum.** One of the minor prophets. A native of Elkohah, probably in Galilee, he flourished about the 7th cent. B.C. His book consists of predictions of the fall of Nineveh, which took place 606 B.C. The reference to the capture of No-Amon (Thebes) by Ashurbanipal, king of Assyria, further shows that it must have been written later than 666 B.C.

**Naïadaceae.** Family of aquatic herbs once including *Aponogeton*, *Potamogeton*, and *Zostera*, but now comprising only the single genus *Najas*. Two species are found in fresh water in Great Britain. Their small unisexual flowers pollinate under water.

**Naïads** OR **NAÏADES.** In Greek mythology, nymphs of rivers, brooks, springs, and fresh water generally. See *Nymph*.

**Naidu, SAROJINI** (1879-1949). Indian poet and politician. Born in Hyderabad state, Feb. 13, 1879, she was educated at King's College, London, and Girton College, Cambridge. She later published poetry in English which was translated into Indian languages, e.g. *The Golden Threshold*, *The Bird of Time*, and *The Broken Wing*. A friend of Gandhi, she worked for Indian independence

lecturing on social, religious, and educational subjects. A member of the working committee of Indian National Congress and Women's movement, she was president of the Indian National Congress in 1925, and delegate to the London round table conference in 1931. Arrested as participant in the civil disobedience campaign in 1940 and 1942, she was governor of the United Provinces from 1947 until her death, March 2, 1949.

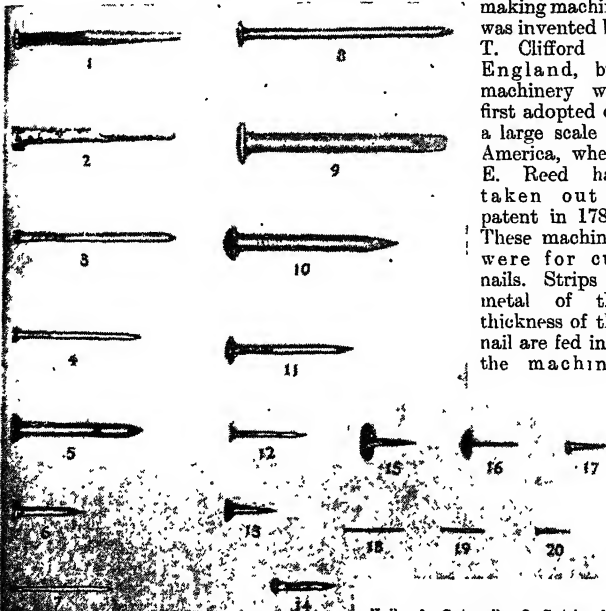

**Naihati.** Town of W. Bengal, India. It is situated on the left bank of the Hooghly, 24 m. above Calcutta. Pop. 51,000.

**Naik.** Non-commissioned officer in the armies of India and Pakistan, equivalent to corporal in the British army. Holders of similar rank in cavalry regiments are known as daffadars.

**Nail.** Metal spike, usually having a point and a broadened head, used for attaching wood or metal parts to wood. Tree-nails (or trenails) are hard wooden pegs for a similar purpose, used (e.g.) for oak, where metal nails would become corroded. Metal nails are made of iron (mild steel), brass, copper, zinc, and various alloys; those to resist corrosion are galvanised, tinned, or coated in other ways. Steel nails may be "brassed" or "coppered" to give a desired appearance, or to utilise the greater strength of the steel. Screwnails are twisted in the shank spirally so that when driven they rotate and are drawn into the wood.

Cut nails like 1 and 2 (illus. p. 5950) are stamped from plate of appropriate gauge. Wrought nails are formed by a forging process to give an enlarged or ornamental head. Large types of nail are cast. Wire nails, most extensively used today, are formed from wire of suitable shape and gauge by machine, being headed and pointed in a continuous operation. The full range extends from 10 ins. long by  $\frac{3}{8}$  in. diam. in the round variety (No. 8) down to  $\frac{1}{8}$  in. long and of diameters according to the S.W. Gauges 16, 17, and 18. Oval wire nails (No. 3) are made in 6 ins. long by 6 gauge down to  $\frac{1}{8}$  in. long by 20 gauge—the thickness mentioned being that of the narrowest section of the oval. Panel pin (No. 7) range from 2 ins. by 14 gauge to  $\frac{1}{8}$  in. by 18 and 19 gauge. Wire nails and cut nails for building purposes are described in the British Standard Specification No. 1202: 1944.

Nails used to be distinguished as twopenny, 1 in. long; threepenny,

or floor brad. 3. Oval wire nail. 4. Small ditto. 5. Wall nail. 6. Small clout nail. 7. Panel pin. 8. Round wire nail. 9. Galvanised chisel-pointed roof nail. 10. Bright roofing nail. 11. Brass-headed nail. 12. Lath nail. 13. Small stout tack. 14. Screw nail. 15. Drugget pin. 16. Chair nail. 17. Tinned tack. 18. Cigar-box pin. 19. Small pin. 20. Wire gimp pin

1½ ins. long; and fourpenny, 1½ ins. long. These denominations are still used in the U.S.A.

Until the end of the 18th century practically all nails were hand made, forged from nail rods by the blacksmith. The chief centre for nail-making was in Birmingham, and women and children were largely employed. In 1790 a nail-

which automatically cuts the strips into the required lengths and shapes the heads to correct size.

Wire or "French" nails did not come into general use until about a century later. After entering the machine the wire is led through straightening rolls, and is then gripped by a die which puts on the burrs which roughen the top part of the shank in some types; a cutter

closes in upon the shank at the pre-set length and shapes the point, while at the same time a heading die holds the opposite end to receive the blows of a hammer which forms the enlarged head. Finally a pusher breaks away the finished nail where it has been pointed. The output is about a thousand a minute.

**Nail.** Horny scaly growth at the ends of fingers and toes of human beings and some animals. The human nail consists of three parts: the extremity or apex; the opposite end or root, where it emerges from the flesh; and the

whitish part, termed the lunula, or half-moon. Nails are a special growth of the epidermis or skin tissue. In biology they are homologous with the hoof and claw of other animals. See Horn.

**Nail-Head Spar.** A variety of the mineral calcite (*q.v.*), so called on account of the crystalline form, a combination of the flat rhombohedron and prism.

**Nain.** Ancient town in Galilee, situated 6 m. S.E. of Nazareth, on the summit of Little Hermon, or the hill of Moreh. The ancient town was probably on its summit. It was the home of a youth whom Christ raised from the dead (Luke 7).

**Naini Tal.** District and town of the Uttar union, India, in the Kumaun division. The dist. is situated on the Himalayan slopes N. of Rampur State. The annual rainfall averages 67 ins. A 120-acre lake 6,410 ft. above sea level is a striking feature. It has sulphur springs. The peaks of China (8,568 ft.) and Deopatta (7,589 ft.) enhance the beauty of the scene. On Sept. 18, 1880, a disastrous landslide caused by torrential rain caused heavy loss of life: the day is still kept in memory of those who died in that calamity. Only a sixth of the area is cultivated. The town is a hill station reached by road from the rly. terminus at

Naini Tal, India. The summer station of the United Provinces administration by the lake of Naini Tal

Holdwani. Elevation 6,409 ft. Area, 2,627 sq. m. Pop., dist., 291,000; town, 10,000.

**Nainsook** (Hind., pleasure of the eye). Soft muslin of Indian origin. Nainsooks are either plain or striped, the stripes running lengthways. In India they were sometimes made of silk. See Muslin.

**Nairn.** Royal and mun. burgh and watering-place of Nairnshire, Scotland, on the Moray Firth. It is also the county town.

Nairn seal

Nail. Vertical section through human nail and nail-bed. a, stratum malpighii, and, b, stratum granulosum, of nail-bed; c, deep layers of nail substance; d, superficial layers. Highly magnified

It stands where the Nairn falls into the Moray Firth, 15 m. by rly. from Inverness. The attractions include good bathing and golf links. It has a good harbour. Chief industries are fishing and fish-curing. Nairn, known then as Invernairn, was made a royal burgh in the 12th century. Pop. 4,201.

**Nairne, CAROLINA, BARONESS** (1766-1845). A Scottish ballad-writer. A member of a prominent

Jacobite family, she was born at Gask, Perthshire, Aug. 16, 1766, and in 1806 married William, afterwards Baron Nairne (1757-1830), to whom she bore one son, William (1808-37). Her beauty and charm won for her the name of The Flower of Strathearn. After her husband's death she lived in Ireland and on the Continent, and died at Gask, Oct. 26, 1845. She wrote nearly 100 songs, some of them adaptations of old favourites, among them The Land o' the Leal, Caller Herrin', and The Laird o' Cockpen. They were issued in volume form in 1846 as Lays from Strathearn. See Life and Songs of Lady Nairne, C. Rogers, 1869; Jacobite Lairds of Gask, K. Oliphant, 1870; Lady Nairne and her songs, G. Henderson, 1905; The Oliphants of Gask, Records of a Jacobite Family, M. E. Blair-Oliphant, 1910.

**Nairnshire.** Maritime county of Scotland. It has about 10 m. of coastline on the Moray Firth, and the surface rises towards the S., attaining an alt. of 2,162 ft. in Carn Glas. Its area is 163 sq. m. The

Nairn. General view of the town and banks of the Nairn from the north

chief rivers are the Findhorn and the Nairn. The county is an agricultural area, but much of the land is only suitable for sheep. Nairn is the county town, and in the shire are Cawdor and Kilravock with their castles, and Auldearn. In 1891 detached portions of Nairnshire were absorbed in the counties of Ross, Inverness, and Moray. In early times, Nairn was part of the district called Moray, and it has always had a close association with the shire of that name. It joins with Moray to form a co. constituency. Pop. est. 8,700. Consult History of Moray and Nairn, C. J. G. Rampini, 1897.

**Nairobi.** City of Kenya Colony, E. Africa, capital and centre of administration of the colony. It is situated on an elevated plateau, at a height of 5,475 ft., within easy reach of the Kikuyu and Limoru highlands. It was originally founded, 1899, as a rly. settlement, and still remains the chief rly. centre for Kenya and Uganda, being 327 m. from Mombasa, and 257 m. from Kisumu (Port Florence) on the Victoria Nyanza. It also has an important aerodrome and is the terminus of a motor road that crosses Uganda to Mongalla, Sudan.

The healthy and invigorating climate, due to its altitude, made Nairobi suitable for European settlement, in spite of its two rainy seasons; and it now has the largest European pop. of E. African towns. There are an Anglican cathedral, the McMillan memorial library opened in 1931, and a fine town hall, opened, with

the rebuilt law courts, in 1935. W. of the town is the cantonment of the King's African Rifles. In 1950 Nairobi was incorporated as a city by royal charter, the ceremony being performed, March 30, by the duke of Gloucester. Pop. 111,000, of whom over 10,000 are Europeans.

**Naivasha.** Town and lake in Kenya Colony, E. Africa. It is included in the Nakuru district, which is extensively cultivated. Lake Naivasha is about 12 m. long by 9 m. broad. The hippopotamus is protected in the lake, which is also well stocked with black bass. The township on the E. of the lake is on the Uganda rly., 391 m. from

Nairobi, Kenya Colony. Government Road, an important thoroughfare in this capital city

Mombasa, and 64 m. N.W. of Nairobi. It is a holiday resort.

**Najibabad.** Town of the Uttar union, India, in the Bijnor district. It is situated in the N. of the district, and is a rly. junction on the route from Delhi to Dehra. Pop. 26,898.

**Nakhichevan.** Autonomous republic forming part of Azerbaijan S.S.R. Bordered S. and S.W. by Persia, and N. and E. by Armenia S.S.R., it has an area of 2,488 sq. m. It was constituted in 1921. The surface, consisting of part of the valley of the Araxes in the S.W., rises to 10,000 ft. in the E. The rly. line from Baku to Tbilisi (Tiflis) skirts the S.W. border, and sends a branch line into the interior. For many years on a trade route between Russia and Persia, it was annexed by Russia in 1828. Its capital, of the same

Nairnshire. Map of the Highland county south of Moray Firth

name, is situated 85 m. S.E. of Erivan, and is a centre for the manufacture of textiles, leather goods, pottery, wine, salt, and food products. Pop. 103,600.

**Nakhichevan-on-Don.** Town of the R.S.F.S.R. It is situated on the Don and the Klov-Rostov rly. about 6 m. N.E. of Rostov-on-Don. Candles, cotton goods, and bricks are chief products. It was founded in 1780 by Armenian immigrants. Pop. 71,321.

**Nalchik.** Town of U.S.S.R., capital of Balkaria-Kabardin A.R. It is situated 150 m. W. of Grozny in the Caucasus. It was evacuated by the Russians on Nov. 2, 1942, in the face of heavy German pressure, and was left in flames. Russian forces retook the town on Jan. 4, 1943.

**Nama or NAMAQUA.** Division of the Hottentot people, mostly in Namaqualand, S.W. Africa protectorate. Numbering 14,000, they have preserved their racial type and speech more completely than the Korana division, who remained behind in the upper Orange basin. From 1881 to 1906 they were in incessant conflict either with the Herero, or with the Germans. Despite missionary influence they still cling to their ancestral pastoral nomadism. See Hottentot.

**Namangan, or NAMANCHAN.** A town of Uzbek S.S.R. It is in the valley of the Syr-Daria, 50 m. by rly. N.E. of Khokand. Considerable trade is carried on in cotton, fruit, hides, and sheep. In the neighbourhood are naphtha wells and coalbeds. Pop. 77,351.

**Namaqualand, GREAT.** Country in the S.W. Africa Protectorate, formerly German S. W. Africa. Extending from the Orange River to Damaraland, it is mainly a sterile desert region, and was occupied by the Germans in 1885. It is inhabited by the Namas, a few bushmen, some tribes of Hottentots, and white settlers. See South-West Africa.

**Namaqualand, LITTLE.** Dist. in the Cape Province. It lies S. of the Orange River, by which it is separated from Great Namaqualand. Diamonds and copper are exported from Port Nolloth. Area 20,000 sq. m. Pop. 25,847.

**Namasagali.** Port on the Victoria Nile. It is connected by the Busoga rly. with Jinja. A steamer service runs to Foweira, 160 m. N.N.W.

**Nam-dinh.** Town of Vietnam in Tong-king, on the rly. from Hanoi to Hué and Tourane. It is 45 m. S.E. of Hanoi, on the Songka. There is a trade in silk and cottons.

**Name.** Title by which any person or object is indicated; in a narrower sense, the name given to a person or object to distinguish it from others of the same class. The manner in which personal names were given varied among different peoples, but names taken from personal characteristics and peculiarities are common to all.

In the U.K. a person may change his surname as he pleases. His name is that by which he is generally known. Although during the Second Great War an advertisement in the London Gazette had to be published, no formalities are now necessary for a change of name, but to preserve evidence of change it is sometimes desirable to execute a deed poll, or in rare cases to obtain a royal licence or the passing of a private Act. To have the name changed on ration books and identity cards, notice must be given to the authority issuing the document.

A Christian name, i.e. one given at baptism, cannot be changed except by the bishop at the time of confirmation; by Act of parliament; or on the legal adoption of the bearer of the name, when another name may be added. A person who has not been christened may change his first name or names in the same way as his surname. A woman on marriage in England usually takes the surname of her husband, but need not. In Scotland she still uses her maiden name in legal documents. On divorce she may revert to her maiden name.

The Greeks had no names answering to surnames, and it was left to the parent to decide what name the child should have. Most Greek names were compound—*Leuk-hippos* (with white horses), *Thrasylbulus* (bold in counsel). In oldest times, the child as a rule took the name of his grandfather, sometimes that of his father. For the sake of distinction a patronymic was often added—Agamemnon Atrides, Agamemnon the son of Atreus; or the father's name was added in the genitive—Cimon of Pericles.

The Romans originally had only one name—e.g. Romulus—but in republican times three names became the rule: *praenomen*, answering to the modern given name—Aulus, Marcus, usually abbreviated to A., M.; *nomen*, the gentile or clan name, nearly always ending in *-ius*, e.g. Julius, Tullius; *cognomen*, the family name, Caesar, Cicero. A fourth name, *agnomen*, was given for famous deeds, such as Afri-

canus, and in cases of adoption, when the adopted son took the three names of his adoptive father, to which he added that of his own clan or gens (*q.v.*), with an altered termination. Women as a rule had the clan or gens name of their father with a feminine termination, e.g. Tullia.

In England many names are derived from personal characteristics, and are really mere epithets. Patronymics are formed by adding son, e.g. Johnson, Thompson, a favourite method in Scandinavian countries. English surnames may be classified as general and special local names—Hill, Dale, Burton, Buxton; names of occupation—Barber, Brewer, Baker, including lost trades, Fletcher, Fargiter, Reeve; names formed from first names, as Wilkinson, Wills, Willis, from William; names of mental or physical characteristics—Good, Wise, Long, Black, White. A great many of the first names in common use are of religious origin.

Among the Spaniards, names derived from the father end in *-ez*, e.g. Hernandez, the son of Hernando. The old Persians and Indians had compound names, like those in earliest use among the Greeks and Germans. Among the Indians and Hebrews religious names were common—Kaldasa, servant of the goddess Kali, Eliezer, whom God helps. The Arabs form a *praenomen* by the aid of the prefix *abu*, father; names like Hassan, which did not descend from father to son, were usually followed by the name of the father, with an interpolated *-ibn-* or *-ben-*, son of—Hassan-ibn-el-Abbas; other names were taken from religion and court—Salah ed-din, safety of faith, Saladin; from a man's occupation, tribe, birthplace, or sect, while others were pure nicknames. Among the Chinese the *praenomen* is not definitely established, and may be changed until a person enters an educational institution or becomes the holder of a public office.

In some ecclesiastical classes, such as monks and nuns, a new first name is adopted when certain final vows are taken. The pope, on election, takes a new name. Monarchs, on assuming the throne, occasionally use a name by which they had not previously been known, e.g. King George VI had been known during his father's reign as Albert, Duke of York.

Geographical names are often intended to convey to the mind a kind of picture representing the most salient physical features.

Such are Benmore, Morven, both meaning great mountain; Mont Blanc, white mountain. In Celtic Aber, Inver denote places at the mouth of a river—Aberconway, Aberdeen, Aberfeldie and Inver-geldie, Inverness. Ard, Craig, Drum, Fell, Pen, Tor, and others refer to high ground generally—Ardglass, green height; Craigmore, great rock; Drumlane, broad ridge; Scawfell, the mountain of the promontory; Penmaenmawr, the great stone head; Torbay, the hill over the bay. There are frequent references to colour, plant and animal life. *See* Place Name.

**Bibliography.** Dictionary of English and Welsh surnames, C. W. Bardsley, 1901; Words and Places, I. Taylor, 1909; Words and Names, E. Weekley, 1932; Jack and Jill, E. Weekley, 1939.

**NAMING CUSTOMS.** Rites and usages attend the choice and bestowal of personal names. In primitive culture an underlying notion is traceable that names are the substance of individual souls expressed by the voice. So the Eskimo, by naming children after the person last deceased in the village, seek to perpetuate the tribal soul, while the Aztec, by bestowing the name of a dead relative, did the same for the family-soul.

As death or injury may result from the malevolent misuse of names, they are frequently kept secret, sometimes by entrusting them to material objects buried out of sight, other designations being employed in ordinary life. This idea is extended to divine names. Moreover, such crises as initiation, marriage, social promotion, and death necessitate name-changing, by replacement or accumulation, the Kwakiutl even having summer and winter names. Name-changing is also practised for deceiving disease-demons or counteracting sorcery, while opprobrious names, such as Three-farthings, Dustheap, Perdita (lost), are frequently bestowed in infancy to avert evil eye.

A widely observed custom called teknonymy (Gr. *teknon*, child, *onoma*, name), requires fathers to drop their previous names at the birth of sons, and to assume instead the sons' names, or names meaning father of N. Many peoples, e.g. Fuegians and Malays, taboo the names of the deceased, and in Tahiti and Zululand extend this to all related words in the language, for a time at least.

**Name, FEAST OF THE.** Roman Catholic feast in honour of the Blessed Virgin Mary. It arose in

Cuenca, Spain, in the 16th century, and is one of 20 of a similar character. First kept on Sept. 22, then on Sept. 8, it is now observed on Sept. 12.

**Name Day.** A term in the London and other Stock Exchanges. It was applied to the second day of the fortnightly settlement, when the names of the purchasers of stocks and shares are handed in by the brokers concerned, preparatory to the pay day following. In the First Great War, when the fortnightly settlements were abandoned, there were no name days, transactions being settled daily.

**Namoi OR PEEL RIVER.** Rivér of New South Wales, Australia. It rises in the Liverpool Range and flows for about 600 m. N.N.W. to join the Barwon or Darling river. Its upper valley, almost encircled by mountain ranges, is a valuable wheat-growing area. The lower valley is a pastoral area.

**Namsos.** Town and seaport of Norway. Situated at the mouth of the Namsen river, it is 85 m. N.E. of Trondhjem, with which it is connected by rly. Industries are fishing and boat building. Pop. approx. 4,000.

Namsos was used as an Allied base during the brief Norwegian campaign, 1940. On April 14, a British naval detachment landed at the port, followed by British and French troops a few days later. The British and French forces N. of Trondhjem were evacuated from Namsos on May 2. The town was devastated by repeated German bombing raids. *See* Norway.

well cultivated, the S.E. part is covered with valuable forests, representing a continuation N. of the French Ardennes. The Sambre valley is the chief industrial area, and there are rly. services to all important towns. Namur is the capital, the three arrondissements being Namur, Dinant, and Philippeville. Area, 1,414 sq. m. Pop. 352,173.

**Namur** (Flemish, Naemen). Town of Belgium, capital of the prov. of Namur. It lies 35 m. by rly. S.E. of Brussels, at the confluence of the Sambre and Meuse. The disused citadel stands between the two rivers, and Salzinnes, Belgrade, S. Nicolas, and Jambes are suburbs connected by tramway with the town.

Namur is a rly. junction, has barracks and other military buildings, law courts, and a prison. The industries include the manufacture of cutlery, leather, iron-work, and distilling, as well as firearms and tobacco. The 18th century cathedral of S. Aubain, in Renaissance style, on the site of an earlier building, contains the

Namur, Belgium. The Pont de Jambes over the Meuse, showing the citadel. Upper picture, west front of the cathedral of S. Aubain

**Namur.** Prov. of Belgium. It is contiguous with the provs. of Brabant, Hainault, Liège, and Luxembourg, and with France. The surface is generally hilly, and the prov. is intersected by the deep and picturesque valley of the Meuse. The fertile soil of the N. is

heart of Don John of Austria. The 17th century church of S. Loup is a good example of the Baroque style. The late 14th century belfry was rebuilt in the 16th. There are museums of archaeology, and above the citadel is a finely laid-out park. Pop. 32,000.

**Namur, SIEGES OF.** In the war of the Grand Alliance, the French under Vauban invested Namur, May 26, 1692, and captured the town on June 5, and the citadel itself on June 23. Namur was defended by the Dutch engineer, Menno van Coehoorn (1641-1704), who constructed its fortifications. In 1695, however, William III of England, with Coehoorn, besieged the town, now defended by Boufflers, and after 67 days' investment captured the citadel on Aug. 30, 1695. The later fortifications were constructed in 1888 by Brialmont as part of the Meuse Valley system.

At the outbreak of the First Great War, Namur was ringed by nine armoured forts with 350 guns and a garrison of 30,000. It was the focal point of six railways and, after the fall of Liège, became the hinge on which the French armies were to manoeuvre in their attempt to outflank the Germans in Belgium. On Aug. 19, 1914, the German army invested the fortress and two days later opened a heavy bombardment of the three eastern forts. Next day a sortie by the garrison, supported by part of the French 5th army, failed in an attack on the German artillery positions, and the French were obliged to retreat. By Aug. 23, only three of the forts remained in action, and the Belgian field army was obliged to retire in the face of the rapid advance of the German infantry, who entered Namur that evening. On Aug. 25, the last forts were silenced and the German occupation of Namur completed at a cost of 12,000 casualties. The Allied losses were approximately the same.

During the Second Great War, when the Germans invaded Belgium on May 10, 1940, Namur formed the S. bastion of the Namur-Liège line along which the Belgian high command planned to fight the delaying action essential until the British and French could take up positions along a line from Antwerp through Namur to Givet on the French frontier. The Belgians were then to withdraw to the main defence line stretching from Namur to Antwerp. By May 11, however, the enemy had advanced so rapidly that the Belgians were immediately forced back, without any delaying action, on the Antwerp-Namur line. Namur itself was defended by the Belgian 7th army corps. Following the

German breakthrough at Sedan, the Allied positions in central Belgium became untenable, and the Belgian army corps was withdrawn from Namur, although some of the individual forts continued resistance until the general Belgian surrender. Namur was liberated by U.S. forces on Sept. 5, 1944, during the Allied sweep through Belgium.

**Nanai.** A people of the Komi-Zyrian A.R. (*q.v.*), R.S.F.S.R., their chief town being Naryan Mar.

**Nanaimo.** Town and port on Vancouver Island, Canada. Situ-

ated 1853, he lost no opportunity of fomenting discontent in the disaffected parts of India. On the outbreak of the Mutiny he proclaimed himself peshwa, wreaking his vengeance on the British by ordering the massacre at Cawnpore (*q.v.*). On the suppression of the Mutiny Nana fled to the Terai jungles of Nepal, where it is reported he died.

**Nanchang.** Capital of Kiangsi prov., China. It is situated on the Kan river, and was formerly on the Po-yang Lake, which has since

Nancy, France. Left, west front of the cathedral; right, Government Palace and its courtyard, formerly the residence of the governors of the province

ated 65 m. N.E. of Victoria, it has a station on a branch rly. and a good harbour, whence steamers go to Vancouver, Victoria, and elsewhere. There are saw mills and brickyards, and fishing and fish curing are carried on. Coal is found in the neighbourhood and exported. The town was a post of the Hudson Bay Co. Pop. 6,635.

**Nana Sahib** (*f.* 1857). Leader in the Indian Mutiny, 1857-58. A Mahratta Brahmin, Dundhu Panth by name, he was born about 1821 and was the adopted son of the last peshwa Baji Rao. Incensed at the British refusal to continue the pension after his father's death,

Nana Sahib. Notorious leader of the Indian Mutiny. He ordered the massacre of Cawnpore

receded some 30 m. Nanchang is connected by rly. with Kiukiang on the Yang-tse. Pop. 412,000.

**Nancy.** French town, capital of the dept. of Meurthe-et-Moselle. It stands on the Meurthe and the Rhine-Marne canal, 220 m. E. of Paris. It was the capital of the former duchy of Lorraine before the war of 1870. The Place Stanislas, the principal square, was laid out by Stanislaus Leszcinski, who became duke of Lorraine on his abdication from the Polish throne in 1736. Interesting buildings include the Cordelier church (15th century), the ducal palace (16th century, though partly rebuilt later), the town hall (17th century), and the Pépinière (1765). The town was founded in the 11th century and here Charles the Bold was defeated by the Swiss in 1477. Charles III laid the first stone of the handsome new town in 1608.

Nancy is the seat of a bishopric and a university. It possesses theatres, libraries, and museums, and the school of forestry which is unique in France. Its industries include textiles, chemicals, ceramics, and iron and wood products, and the manufacture of tobacco. It is an important military centre and has three airports, two under military control. Pop. 113,477.

On Aug. 24, 1914, a German army advancing from Metz attacked the retreating French, who were holding the Grand Couronne.

a semi-circular ridge to the N. of Nancy. The next day the enemy reached Rozelieures, but a French counter-attack took the Germans by surprise and in the three days much ground was regained. Both sides were too exhausted to continue the struggle immediately, and there was a lull in the fighting until Sept. 4, when the Germans launched a new offensive and compelled the French to yield some ground. By pushing up the valley of the Moselle, the enemy took the French in the rear and threatened to penetrate between Nancy and Toule. Although the German advance was eventually held, the French were too exhausted to counter-attack. On Sept. 10, fresh French troops were brought up and a determined attempt made to regain the lost ground; this proved so successful that on Sept. 12 the Germans began a general retreat and the French entered Luneville. About 200,000 French troops were engaged against 250,000 Germans led by Prince Ruprecht. The action was notable as one of the first occasions of the First Great War on which the German army suffered a serious reverse, and it did much to hearten the French in their campaign to halt the German advance into France.

During the Second Great War Nancy was captured by the Germans, June 19, 1940, and after the Franco-German armistice lay within the German-occupied zone of France. It was German supreme command H.Q. in France until shortly before the U.S. 3rd army entered it Sept. 15, 1944, to find it already in the hands of the F.F.I. The Germans blew up the bridges across the Meurthe and the electricity and gasworks; otherwise the town was virtually undamaged.

In Dec., 1947, disastrous floods destroyed 2,000 homes in the town.

**Nanda Devi.** Peak of the Himalaya Mts., India. It rises to 25,845 ft. above the plains of Kumaun in the N. of the Uttar union. The 1933 Everest expedition attempted an ascent.

**Nander.** Town of the state of Hyderabad, India. It is situated on the left bank of the Godavari, 126 m. S.W. of Amraoti, with which it is connected by road, on the Bombay-Hyderabad railway. Pop. 21,470.

**Nandgaon.** A former state of India, now part of the Madhya union. It lies on the watershed between the Wainganga and Mahanadi valleys. Rice, wheat, and cotton are grown. The capital is

Rajnandgaon, on the rly. between Nagpur and Raipur; it has cotton, oil and rice mills. Area 872 sq. m. Pop. 202,973.

Nanking, China. Avenue of giant statues, leading to the royal tombs of the Ming dynasty

**Nandi.** Nilotic negro people in Nyanza prov., Kenya. Migrant from Lake Rudolf, they colonised the Nandi plateau, 8,000 ft. high, and other forested uplands to N. and S. They have imparted their language and culture to the Dorobo hunters of Masailand. The main type, short, small-faced, prognathous negroids, are mingled with a caucasoid, big-nosed, straight-jawed type betraying Galla contact. In consequence of their depredations on the railways and telegraphs they were removed in 1906 to reserves. See Negro.

**Nanga Parbat.** Peak of the Himalaya Mts., Kashmir. It rises to 26,629 ft. in the Zaskar Range in the S.W. of Baltistan. Here the Indus flowing N.W. through Baltistan makes its great bend round the mighty peak, to flow W. and then S.W. through the Punjab.

**Nankeen.** Yellowish cotton fabric said to have been first made at Nanking, China. Originally it was made from *Gossypium religiosum*, a brownish-yellow native cotton, and was undyed. Nankeen is now made in Europe and other countries from ordinary cotton, dyed yellow, and is exported to China.

**Nanking.** Capital of Kiangsu prov., China. It is situated on the Yang-tse, though the walled city lies away from the river, nearly 200 m. from the mouth. Its port is accessible to ocean-going steamers all the year round. The circuit of the walls is over 20 m. Near by are the Ming tombs, including that of the founder of the dynasty, Hung Wo.

The town is said to have given its name to Nankeen cloth. Among its other manufactures are satin crêpe and Indian ink. Government establishments include an arsenal, a powder works, and a mint. There are a university, a naval college,

and an agricultural experimental station, with a school of forestry. The town is connected by rly. with Shanghai, and Pukow, the port on the opposite bank of the Yang-tse, is the terminus of the Tientsin Pukow rly.

Dating from the 5th or 6th century B.C., Nanking (meaning S. capital) was the capital of China for several periods between A.D. 222 and 501, and again from the accession of the Ming dynasty in 1368, until their removal to Peking (Peiping) in 1403. The

city was nearly destroyed by the Taipings, who took it in 1853, and overthrew the famous Porcelain Tower. It was their capital until 1865, and gradually recovered. At Nanking the first treaty between the U.K. and China was signed, 1842. In 1928 the victorious Nationalists moved the capital from Peiping to Nanking, but, after having been repeatedly bombed by Japanese aircraft during 1937, it was captured on Dec. 13, 1937, British and American gunboats being sunk during the final attack. During the Japanese occupation it was for a time the capital of the Japanese-sponsored Chinese government under Wang Chung-Wei. On Aug. 25, 1945, Chinese nationalist troops entered Nanking, where the formal surrender of the Japanese forces in China took place on Sept. 5. In 1946 the nationalist govt. again made Nanking the capital. Pop. 1,100,000. See China in N.V.

**Nanning.** City of China, in Kwangsi prov. Standing on the Si Kiang or West River, 320 m. W. by S. of Canton, it was opened as a treaty port in 1907. Pop. 52,000.

**Nansen, FRIDTJOF** (1861-1930). Norwegian explorer and administrator. Born near Christiania (Oslo). Oct. 10, 1861, he graduated from Christiania university and was appointed curator of the natural history museum at Bergen. In 1888-89 he

Fridtjof Nansen, Norwegian explorer

crossed the Greenland icefield from E. to W., studying the people and natural history, as recorded in *The First Crossing of Greenland* (1890) and *Eskimo Life* (1893).

In 1893 he embarked in the Fram on an Arctic polar expedition. Skirting the N. coasts of Europe and Asia, he allowed his vessel to drift with an icefloe, and then, with one companion, he pushed across the ice on foot until he reached 86° 14' N., the farthest point then attained. He wintered in Franz Joseph Land, and was ultimately picked up in 1896 by the Jackson-Harmsworth expedition. Upon his return to Norway his book *Farthest North* (1897) became a best-seller. He lectured in London and other places on his Arctic experiences and observations. From 1905 he took an active part in Norwegian politics, and had much to do with the separation of Norway from Sweden. He was appointed the first Norwegian ambassador to Great Britain, resigning in 1908 to carry out oceanographic research in the Arctic. In 1917 he went to the U.S.A. as head of a govt. mission to negotiate food supplies, and in 1919 became chief Norwegian delegate to the League of Nations. In 1920 he was appointed director of an international organization for repatriating ex-prisoners of war from Siberia. This organization developed into the Nansen office (*v.i.*). During 1921-23 he was also director of famine relief in Russia, and was responsible for feeding 12,000,000 persons. He was awarded the Nobel peace prize in 1923 and devoted the money to the furtherance of demonstration farms he established at Saratov. In 1921 he had been appointed prof. of oceanography at Christiania (Oslo) university, and in 1926 he refused the premiership of Norway. In 1928 he published *Armenia and the Near East*. He died suddenly at Oslo, May 13, 1930, preparing an airship expedition to the N. Pole. *Consult* Lives, E. S. Starritt, 1930; J. Sorensen, 1932; E. E. Reynolds, 1932; C. Turley, 1933.

**Nansen Office.** Former international organization for the assistance of refugees. It evolved from the refugee work of the League of Nations, begun in 1920 under the direction of Nansen (*v.s.*), and upon his death in 1930 was constituted as an autonomous organization by the league. It was primarily concerned with 3,000,000 White Russians, many of whom were settled in Poland and China; 800,000 Armenians, settled largely in Near Eastern countries; 1,500,000 Greeks, expelled from nationalist Turkey and eventually established in Greece in exchange for Turks living in that country,

and some thousands of Assyrians. Large numbers of refugees from the Saar (*q.v.*) were established in France and the Argentine.

The Nansen office was responsible for collecting information regarding the moral and material condition of the refugees and for assisting them to find employment and opportunities for settlement. Schools, hospitals, and churches were built, a children's home maintained near Paris, and a home for the aged at Nice. Until they were able to acquire a definite nationality, refugees were provided with temporary identity papers called Nansen passports (*v.i.*). The work of the office was financed by a grant from the league, subsidies from governments, gifts from institutions and individuals, and the sale of surcharged postage stamps in France and Norway. In 1937 the humanitarian activities of the Nansen office were recognized by the award of the Nobel peace prize. In 1938, when the number of refugees under its control had fallen below 5,000, the office was closed and its work transferred to a high commissioner appointed by the League of Nations. *See* Refugees.

**Nansen Passport.** Identity document devised by Fridtjof Nansen (*q.v.*) and granted through the Nansen Office (*v.s.*) to stateless refugees. The "passport" established a provisional legal status for the holder until such time as he could acquire a definite nationality in the country in which he had settled. A Nansen passport was recognized by most governments and gave the holder a limited freedom of movement, enabled him to obtain small loans of money, and entitled him to reductions on rail and steamer fares. The passports ceased to be valid when the Nansen Office closed in 1938.

**Nanshan.** Mt. range of Asia. It comprises parallel ridges between the Gobi desert and the Tsaidam Swamp on the N.E. boundary of Tibet. The range, alt. 14,000-16,000 ft., which has a general direction N.W. and S.E., is a continuation of the Kwenlun and Altyn Tagh systems. Among the names given to sections of the Nanshan Range are the Alexander III, the Humboldt, the Ritter, and the Amne-Machin Mts.

There is a second range of the same name S. of the Yangtse, running parallel with the coast from Kwangsi to Chekiang prov. Its greatest alt. is 9,500 ft.

**Nanshan, BATTLE OF.** Fight between the Russians and the Japanese, May 26 1904. Japan

having Korea in her hands, determined to capture Port Arthur, and this battle virtually marks the beginning of the siege. The second army under Oku had been embarked during April and began to land near Pitzewu on May 5, but it took nearly three weeks for the whole disembarkation and for the extension across the peninsula.

Having captured Kinchow, Oku provided a guard to the N. against a relieving force, and, turning to the S., found himself faced by the naturally strong position of Nanshan, a line of hills, 300 ft. high in the centre, across the narrowest part of the peninsula, both flanks resting on the sea, the left (W.) ending in precipitous cliffs, and the right supported by the fire of Russian gunboats. The position was held by about 12,000 Russians, carefully entrenched, and with their front covered by formidable obstacles, but was engaged by the Japanese. Their first rush at dawn on May 26 only carried them up to the beginning of the obstacles, but through this day of stress they made nine successive attempts to carry the position, losing heavily, in the effort to find a weak flank. Towards evening an attack pushed strenuously all along the line carried out the scheme. A division on their right, powerfully aided by artillery fire from land and sea, waded along the coast, and swarming up the cliffs, turned the Russian left.

Stössel, in command at Port Arthur, although only 3,000 of his men had actually been engaged, and he had lost about 1,500 men, ordered a retirement to the prepared positions in rear. It was a decided Japanese victory, for they had captured many guns, and were now in a position to begin the investment of Port Arthur. *See* Port Arthur; Russo-Japanese War.

**Nanterre.** Village of France. It is 5½ m. N.W. of Paris, and was the birthplace of S. Geneviève, whose prayers are said to have preserved the city from Attila. The church contains an alleged fragment of the true cross, an object of veneration by pilgrims for centuries. Pop. 41,860. *See* Geneviève.

**Nantes.** City of France. It is the capital of the dept. of Loire-Inférieure, and is built on several islands of the Loire, 248 m. S.W. of Paris. It is the 8th largest town in France, and although 35 m. from

Nantes arm.

the sea, it is a great port, with an annual turnover between 1.5 and 2 million tons, a ship building centre, and a naval arsenal. The quays extend for 2 m. and before the Second Great War it had 21 bridges across the river. The seat of a bishopric from the 4th century, it has the cathedral of S. Pierre, built in the 6th century, but

Nantes, meeting little opposition from the Germans, who had, however, carried out demolitions, including that of the old Pont de la Vendée.

**Nantes, EDICT OF.** Law or edict issued in 1598 by Henry IV of France, giving liberty of worship to the Huguenots. The accession of the Protestant Henry of Navarre to the throne of France in 1589 and his conversion to Roman Catholicism brought no immediate relief to the Huguenots, who still suffered serious disabilities, despite the various pacifications attempted in the course of nearly 40 years of religious warfare. At length meetings were arranged between the king and the Protestant leaders, and the edict signed at Nantes by Henry, April 15, 1598, contained a large number of articles, the effect of which was to give civil and some religious liberty to the Huguenots.

They could hold meetings for worship in certain specified places, although not in Paris. They could fill official positions and enter universities, colleges, etc., while their pastors were paid by the state. They could trade freely and inherit property. As security they were given 100 places as cities of refuge, and disputes about the edict were heard before special courts in which they were represented among the judges. These courts were connected with the various parlements. The edict was revoked by Louis XIV in Oct., 1685, after the Huguenots had been steadily losing their rights under it for some years. See France: History.

**Nanteuil, ROBERT (c. 1623-78).** French engraver. He was born at Reims and about 1646 entered the studio

of Nicholas Regnesson at Paris. In 1658 he was appointed engraver and designer to the king. By this time he had evolved a clear and beautiful method of engraving, and his crayon portraits were also held in high esteem.

**Nantgarw.** Village of Glamorganshire, Wales. In the valley of the Taff, it is 5 m. from Cardiff. It gives its name to a variety of china. In 1811 Billingsley, the flower painter, opened a factory here. He had been associated with Duesbury at the famous works where Crown Derby was produced. Thence he went, in 1796, to Pinxton, and in 1803 to Torksey, opening a pottery in both places, and finally to Nantgarw. His Nantgarw pottery is unique, the fine body of even texture being more like glass than china. See Pottery.

**Nanticoke.** City of Pennsylvania, U.S.A., in Luzerne co. It stands on the Susquehanna R., 18 m. S.W. of Wilkes-Barre, and served by the Pennsylvania and other rlys. Anthracite is extensively worked in the area—among the world's richest coal-mining districts. It owed its foundation to the water-power provided by the falls here, and industrial establishments include hosiery, knitting, silk, timber, flour, and grist mills, as well as factories manufacturing mining and agricultural equipment. About 10,000 miners work in the neighbourhood. Nanticoke was incorporated as a borough in 1874, and as a city in 1926. Pop. 24,387.

**Nantucket.** Town of Massachusetts U.S.A., co. seat of Nantucket co. It stands on the N. coast of Nantucket island which, with adjacent islands of Tucker-nuck and Muskeget, forms the co., and has steamboat communication ports on the mainland and neighbouring islands.

The island, which is 15 m. long and 3 m. wide, but which has 88 m. of coast-line, is situated 30 m. S.E. of Cape Cod and Buzzard's Bay. Owing to the influence of the Gulf Stream, it has warmer summers and milder winters than the adjacent mainland. An important whaling centre in the 18th and early 19th centuries, its population was chiefly Quaker, and in 1835 it was the state's third richest commercial centre. It is now a favourite resort, and retains many of its original houses, e.g. the oldest house built in 1686, the Old Mill, the South or Unitarian church, the Historical Museum, and the Whaling Museum. It was first settled in 1659. Pop. 3,401.

Nantes, France. West front of the cathedral of S. Pierre, with its elaborately ornamented portals

extensively rebuilt at later dates. Other interesting buildings are the church of S. James (12th century), the prefecture (1763), the stock exchange (1792), and a number of ancient houses. The castle of the dukes of Brittany dates in part from the 14th century. The main industries, apart from those associated with the port, are engineering, paper-making, chemical manufactures, and food preserving.

Nantes was the capital of the Gallic tribe of the Namnetes, and was for long ruled by Breton dukes. It came under French rule in 1491, and there, in 1598, Henry IV signed the famous edict (*v.i.*) granting religious freedom to the Huguenots. Pop. 200,265.

Nantes was one of the ports used by the B.E.F. in Sept., 1939, and it served also as a maintenance depot. On June 20, 1940, the port was taken by German troops and included in the occupied zone after the Franco-German armistice. Allied aircraft made several attacks on the dock area during the German occupation. On August 9, 1944, U.S. armoured columns entered

Robert Nanteuil, French engraver  
Self-portrait

**Nantwich.** Urban dist. and market town of Cheshire, England. It stands on the Weaver, 161 m.

Nantwich arms

N.W. of London, and 4 m. S.W. of Crewe, and is served by rly. The chief building is the old cruciform church of S. Mary and S. Nicholas. There are a 17th century grammar school and some old houses. The industries include the manufacture of leather goods and high-class clothing. Nantwich is a hunting centre and has a spa. It had fairs and markets in the Middle Ages, and salt, of which industry it was a centre, was worked early. The works were especially prosperous in the 16th-18th centuries, after which they declined and have now disappeared. Shoes and gloves were also made at that time. Market days, Thurs. and Sat. Pop. 9,000. *Consult* History of Nantwich, J. Hall, 1883.

#### Nantyglo and

**Blaina.** Urban dist. of Monmouthshire, England. It is 7 m. W.S.W. of Abergavenny, on the rly., and is a coal-mining area. The water supply is controlled by the council. Pop. 11,410.

**Naomi.** Character in the O.T. book of Ruth (*q.v.*). Wife of Elimelech, of Bethlehem-Judah, she lost her husband and two sons in the land of Moab, whither the family had fled through famine. Back in her native land, her many sufferings caused her to say, Call me not Naomi (pleasant), call me Mara (bitter). Ruth was her daughter-in-law.

**Naoroji, Dadabhai** (1825-1917). Indian politician. Born at Bombay, Sept. 4, 1825, the son of a Parsee priest, he was educated at Elphinstone school and college. He returned to it in 1854-55 as professor of mathematics and natural philosophy. Then he went to England to engage in business. Elected in 1892 as Liberal M.P. for Central Finsbury, he was the first Indian member to sit in the British house of commons, but lost his seat in 1895. In 1886 and 1893 he was president of the Indian national congress. He published *Poverty and Un-British Rule in India*, 1901. He died July 1, 1917.

**Nap** or **NAPOLEON.** Card game, usually for three to five players. It is played with a full pack, the cards bearing the same value as in whist. The dealer gives five cards to each player, the one on his left having first call. There are calls of two tricks, *misère* (in which the caller undertakes to lose every trick), three, four, and five tricks, the last being known as *nap*. The player calling the highest leads, and endeavours to make his tricks; he chooses his own trumps, the first card he plays indicating the suit. If he makes the contract he receives payment according to the number of his call; or, failing, has to pay each player in the same proportion. It is usual for the caller of *nap*, when successful, to be paid double stakes. Also it is

Nantwich, Cheshire. Cruciform parish church of S. Mary and S. Nicholas

sometimes agreed that a player going *nap* may have the option of picking up the top card of the remainder of the pack and substituting it for one of the five he originally received from the dealer.

**Napata.** Ancient Nubian city on the right bank of the Nile, under Mount Barkal, below the 4th cataract. An early centre of Sudanese trade, it became the S. frontier of XVIIIth-dynasty Egypt, and immigrant Theban priests established control over the independent Ethiopian kingdom which gave Egypt its XXVth dynasty. The slender pyramids, Amon temple, and funerary shrine of Taharka (2 Kings 19) are essentially Egyptian. *See* Meroë.

**Naphtali.** Name of one of the ten northern tribes of Israel, and of its traditional ancestor, the sixth son of Jacob. He was Bilhah's second son (Gen. 30). The tribe of Naphtali, "a hind let loose," was settled in fertile territory W. and N.W. of the Sea of Galilee, and was among the first to be led into captivity (2 Kings 15; Isaiah 9).

**Naphtha.** Word of Persian origin, referring originally to certain petroleum seepages in Persia. It is now applied to volatile

hydrocarbons obtained by the distillation of crude petroleum, shale oil, and coal tar. Petroleum naphthas are produced by simple distillation of crude oil and, after refining, are redistilled to give fractions of very close boiling range, *e.g.* the 90-120° C. cut which is used for dry cleaning. Naphtha from shale oil is the light distillate occurring during the fractionation of the crude shale oil obtained by retorting oil shale (*q.v.*). Coal tar or solvent naphtha consists of the higher boiling fractions of light oil, the first cut in the distillation of crude tar oil. Naphthas are chiefly used as industrial solvents; the shale oil naphtha is also the basis of a motor spirit.

**Naphthalene.** White solid hydrocarbon, with a characteristic smell, one of the products of the dry distillation of coal. The coal tar of gas works is the chief source of naphthalene. It was discovered by Garden in 1819 in coal tar, and its chemical composition was investigated in 1826 by Faraday, who assigned to it the formula  $C_{10}H_8$ . It forms from 5 to 10 p.c. by weight of crude coal tar, and is obtained on the large scale from the "middle-oil" fraction obtained by distilling coal tar, the oil containing about 30 p.c. of naphthalene. The crude product is purified by treatment with caustic soda to remove phenol and again distilling. The crystalline mass obtained in this way is separated from any adhering oil by means of a filter press.

Naphthalene is employed for making sulphonie acids, naphthols, and naphthylamines needed in the dyeing industry, and especially for the manufacture of phthalic acid required for synthetic indigo and eosin dyes. It is used also for enriching, or carbureting, water-gas to make it luminous, and as alcohocarbon for increasing the luminosity of coal gas. Naphthalene is a powerful antiseptic, and is widely used to preserve woollen goods and furs from moths.

**Naphthol, ALPHA AND BETA.** Solid hydrocarbons, closely related to the phenols in their chemical properties. The chemical formula for the naphthols is  $C_{10}H_7OH$ . Alpha-naphthol is made by fusing naphthalene monosulphonic acid with caustic soda. Beta-naphthol is prepared from beta-naphthalene sulphonie acid. Both are powerful antiseptics, and are used as the starting-point in the manufacture of important aniline dyes. Alpha-naphthol will preserve the albumen used in calico printing.

**Naphthylamine** OR AMIDO-NAPHTHALENE. Hydrocarbon with the chemical formula  $C_{10}H_7N$ . There are two naphthylamines, alpha and beta. Alpha-naphthylamine has a repulsive odour, while beta-naphthylamine is odourless. Both are employed in the manufacture of aniline dyes.

**Napier.** Town and port of North Island, New Zealand. The capital of Hawke's Bay district, it is in a pastoral country. It has rly. and steamer communication with Wellington (200 m.) and Auckland (372 m.). Pop. 20,297.

**Napier, BARON.** Scottish title. The first holder was Sir Archibald Napier 1576-1645, 9th baron

1st Baron Napier,  
Scottish  
agriculturist

Merchiston, who gained celebrity in Scotland for his agricultural experiments, and followed James I to England in 1603. In 1623 he became lord of session, and in 1627 was created baron Napier of Merchiston. Both he and his son, Archibald (d. 1658), 2nd baron, were closely associated with Montrose.

His son, Archibald, the 3rd baron, died unmarried in 1633, when his nephew, Thomas Nicolson, succeeded to the title. The next holder was the 3rd lord's sister, Margaret, from whom it descended to her grandson, Francis Scott, who took the name of Napier. The title is still held by his descendant, Baron Napier and Ettrick.

**Napier of MAGDALA, ROBERT CORNELIS NAPIER, 1st BARON** (1810-90). British soldier. Born at Colombo, Ceylon, Dec. 6,

Baron Napier of  
Magdala,  
British soldier

1810, he entered the Bengal Engineers in 1826, and having specialised in engineering, became chief engineer of the Punjab in 1849. During the Mutiny his work as chief engineer to Sir Colin Campbell brought him a K.C.B. In the Chinese War, 1860, he held a command, but his most notable military service was his conduct of the campaign in Abyssinia, 1868, which brought him a peerage. From 1870-76 Napier was commander-in-chief in India. He died Jan. 14, 1890. See Hist. of the Abyssinian Expedition, C. R. Markham. 1869.

**Napier, SIR CHARLES** (1786-1860). British admiral. Born March 6, 1786, he entered the navy in 1799, saw active service, and in 1810 was with the army in the Peninsula. Returning to the navy, he performed some daring exploits in the Mediterranean.

Sir Charles Napier,  
British admiral

In 1833 he was given command of the Portuguese fleet in opposition to Dom Miguel, whose squadron he defeated. He was hailed as the liberator of the country and raised to the Portuguese peerage, but resigned on the rejection of his proposals for naval reform. He commanded the troops ashore on the Syrian coast in 1840, and was made a K.C.B. for the capture of Acre, where he was second-in-command. His command of the Baltic Fleet in 1854 was only partially successful. He died Nov. 6, 1860.

**Bibliography.** War in Portugal, 1836; War in Syria, 1842; The Navy: Its Past and Present State, 1851; Life and Correspondence, Gen. E. Napier, 2 vols., 1862.

**Napier, SIR CHARLES JAMES** (1782-1853). British soldier. Born in Whitehall, London, Aug. 10,

1782, a grandson of the 5th Lord Napier of Merchiston, he entered the army, 33rd regiment, in 1794, but, except when dealing with the insurgents in Ireland, saw no active service until 1808. He commanded the 50th Foot in the retreat to Corunna, was seriously wounded, and taken prisoner. Released on parole, he was formally exchanged in 1810, and in the following year returned to the Peninsula. In 1815 he took part in the Waterloo campaign, though not present at the actual battle. He was appointed governor of Cephalonia in 1822, but his life was comparatively uneventful until, in 1841, he sailed for India to take command in Sind.

After a campaign Sind was annexed, and Napier was appointed governor of the new province, to the reorganization of which he devoted himself successfully. He rendered further military service in the Sikh war of 1843, and was commander-in-chief in India, 1849-51. He died at Oaklands, near Portsmouth, Aug. 29, 1853. His

life was written by his brother, Sir William, while his own writings include Lights and Shadows of Military Life, 1840.

**Bibliography.** Lives, W. F. P. Napier, 4 vols., 1857; W. N. Bruce, 1885; W. F. Butler, 1890; Records of the Indian Command of Gen. Sir C. J. Napier, J. Mawson, 1851.

**Napier, JOHN** (1550-1617). Scottish mathematician. Born at Merchiston Castle, near Edinburgh, and afterwards the 8th laird of Merchiston, his first mathematical work, De Arte Logistica, suggested that he had discovered a method of solving equations of the second and higher degrees. About 1594 he began to lay the foundations of his great discovery, logarithms, upon which he worked for the next twenty years. In connexion with them he suggested the present notation for decimals. His tables were published 1614, under the title Mirifici Logarithmorum Canonis Descriptio. He died April 4, 1617. See Briggs, H.; Logarithms.

John Napier,  
mathematician

**Napier, SIR WILLIAM FRANCIS PATRICK** (1785-1860). British soldier and historian. A son of George Napier, and a grandson of the 5th lord Napier of Merchiston, he was born Dec. 17, 1785. He entered the army in 1800, and in the 43rd regiment served at the siege of Copenhagen, 1807, before proceeding to Spain, where he was present at Corunna. In 1813-14 he was in command of his regiment which formed part of the Light Brigade. Knighted in 1843, he was promoted general in 1859, and died Feb. 10, 1860. Napier is the author of one of the greatest military histories ever written. His History of the Peninsular War was begun in 1823, and the six volumes appeared between 1828 and 1840.

**Naples** (Ital. *Napoli*). Maritime prov. of W. Italy, in Campania. It curves round the Bay of Naples, and includes the islands of Ischia, Capri, and Procida. A fertile plain in the N., elsewhere it is mountainous, rising in Mt. Vesuvius to about 4,000 ft. It terminates in the S.W. in the promontory of Sorrento. Area 351 sq. m. Pop. 2,000,000.

Sir W. Napier,  
British historian  
From a miniature

Naples. A street scene in the Santa Lucia quarter

**Naples** (Ital. *Napoli*). City and port of Italy and capital of the prov. of Naples. Stretching along

Naples arms

the Bay of Naples, it is perhaps the most beautifully situated city in Europe. Seaward, the bay is protected by islands, Procida, Ischia, and Capri. Inland, a mountain chain hemming in the Neapolitan Campagna, runs down to Sorrento. Rising out of this rich plain the vast cone of Vesuvius towers over the E. suburbs, Portici, Resina, and Torre del Greco, whose villas, vineyards, and orange groves are set upon deposits of lava. To the W. lie the volcanic headland of Posilipo, and Pozzuoli, pierced by sulphurous grottoes and tunnels, the volcano Solfatara, Baia, and the promontory of Miseno. Close to Baia, a volcanic eruption in 1583 flung up Monte Nuovo in a single night, and almost drained the Lucrine lake whfch, with Lake Avernus, formed the Portus Julius of the Roman fleet. The climate is delightful, the mean temp. varying from 47° F. in Jan. to 76° F. in

July. The rainy season lasts from Oct. to March.

The port, always a busy one, was wrecked by bombing and by German demolitions when, during the Second Great War, the Allies entered the city Oct. 1, 1943, after the Germans had withdrawn; 70 ships had been sunk in the harbour. In less than three weeks Allied engineers had made it usable, and for a time it became the port with the biggest turnover in the world. Naples was the principal mounting port for both the assault convoy and the follow-up convoys in the Allied landings in the S. of France, Aug. 15, 1944. U.S. forces remained in control of the port until it was returned to Italian administration March 1, 1946.

The city is a manufacturing centre, making ships, cars, locomotives, glass, cotton, wool, gloves.

summer lounges, give the town an almost eastern appearance. The Porta Capuana, with its Renaissance gateway, 1484 and two round towers, indicate the vanished walls. Three narrow, straight streets, piercing a quadrangle of crooked alleys, are the Decuman Ways of the Roman town.

The modern quarter, built along the magnificent curve of the Riviera de Chiaia, lies to the W. of a mountain ridge which runs down from Capodimonte and the Castle of S. Elmo to the Pizzofalcone promontory. Along this Riviera lie the Villa Nazionale, a charming public garden bordered by the Via Caracciolo, and the famous Marine aquarium belonging to the zoological station founded 1872. At the foot of Pizzofalcone is the historic egg-shaped Castello dell'Ovo, begun 1154 on an islet.

Naples. Plan of the central part of the city showing docks and harbour

perfumes, linen, and silk. The chief imports are coal, steel, lumber, grain, cotton wool, leather, oils, wines, and chemicals: the chief exports, wine, brandy, fruits, nuts, paper, hemp, and cereals. Pop. 1,015,000.

Architecturally Naples has little of interest. The flat roofs of the houses (*astrici*) which serve as

From the Corso Vittorio Emanuele, which winds along the hillside, grand views across the town and harbour are obtained, though the finest of all is afforded by Belvedere, in the Carthusian monastery of San Martino, within the walls of S. Elmo.

The remains of the medieval city are among the narrow fetid streets

1. The Piazza Municipio: here are an equestrian statue of Victor Emmanuel II, and at the end, the Town Hall; in the background can be seen the S. Elmo Castle which was built in 1343 and enlarged later. 2. The maritime station.

3. The new post office. 4. Piazza Dante, with the Vittorio Emanuele school on the right, and a statue of Dante, erected 1872, in the centre. 5. Panorama of the city and bay with Mt. Vesuvius in the background

#### NAPLES: VIEWS OF THE CITY AND SOME OF ITS ARCHITECTURAL FEATURES

of the commercial part of the town to the E. of the ridge. The Strada Sta. Lucia is a typical centre of the noisy, dirty, picturesque, and surprising life of the poorer inhabitants. After the cholera epidemic of 1884 among the densely populated and insanitary streets, a huge reconstruction was begun. The streets were widened, electric trams installed, and a new water supply and drainage system introduced.

The Via Roma, the old Via Toledo, running N. and S., is the main fashionable thoroughfare. It leads down from the Bellini theatre, the Piazza Dante, and the museum to the Palazzo Reale and the old round towers of the Castel Nuovo, 1283, renovated 1905. Close at hand is the San Carlo theatre.

The national museum, formerly the seat of the university, contains the Farnese and other collections (Farnese Bull, Dying Gladiator, Hercules, etc.), and innumerable masterpieces of antiquity and relics from the excavations at Herculaneum, Pompeii, and elsewhere. Some of the contents, stored for safety at Monte Cassino, were lost in the action there, 1944.

The cathedral, built 1272-1323, but repeatedly modernised, contains the tombs of Charles of Anjou and Pope Innocent IV, as well as the alleged blood of S. Januarius, now the patron of the cathedral, which liquefies thrice a year, portending good or evil fortune, according as the process is rapid or slow. The basilica of S. Restituta, on the

site of a temple of Apollo, adjoins the W. aisle.

The coffins of the house of Anjou lie in the sacristy of S. Domenico Maggiore, closely connected with S. Thomas Aquinas. A tall brick campanile in the Strada Tribunali is the remnant of a church built by Bishop Pomponius in 514. In San Lorenzo Boccaccio first beheld and loved Fiammetta. Behind S. Genaro there are interesting catacombs of the 1st century. At the university, founded by the emperor Frederick II in 1224, S. Thomas Aquinas lectured. Reorganized in 1781, it had before the Second Great War over 7,000 students. The Germans deliberately burned the contents of the university library. In the Piazza

Mercato, outside the church of Santa Maria del Carmine (which was badly shaken by bombing from the air in the Second Great War) Conradino was executed, and was buried in the church. The church of S. Chiara, burnt out by incendiary bombs, was famous for its sculptures by Tino da Camaino.

Gianbattista Vico, the famous 17th century philosopher, lived in Naples; the poet Giacomo Leopardi died here from cholera; and Benedetto Croce (b. 1866), philosopher and courageous advocate of liberalism under the Fascists, upheld Neapolitan learning.

Naples was founded by Greek colonists and was first called *Parthenopé*, or Virgin City, after a siren said to have been drowned upon the coast. Re-settled by later emigrants from Greece, it was named *Neapolis*, or the New City. Conquered by the Romans, 326 B.C., the beauty of its site and the mineral springs of Baiae, in the western corner of the gulf of Pozzuoli, rendered it and its environs a favourite seaside resort under the Empire. Baths and villas, built along the shore, encroached even upon the sea. Marius, Pompey, and Julius Caesar had houses at Baiae. Horace loved the place; and here Virgil lived, and chose to be buried. The tomb of Virgil is placed in the Grotta di Sejanio, which was cut through the rock of the hill of Posilipo in Roman times.

**Bibliography.** Tour through the Southern Provinces of Naples, R. K. Craven, 1821; Italy: Rome and Naples, H. A. Taine, Eng. trans. J. Durand, 1867; Naples in 1838, E. N. Rolfe and H. Ingleby, 1888; Naples, Past and Present, A. H. Norway, 1901; Naples and S. Italy, E. Hutton, 1915.

#### The Kingdom of Naples

Naples was also the capital and name city of a kingdom which existed 1138-1860. The Goths, who had occupied Naples on the fall of the Western Empire, were expelled by Belisarius on behalf of Justinian in 536. It was retaken by the Goths under Totila, 543, but recovered by Narses ten years later. As a Byzantine duchy, Naples opposed the Lombard duchy of Benevento, and became practically independent. Enriched by sea-borne commerce with the East, before Venice, Pisa, Leghorn, and Genoa supplanted her, the maritime city offered a tempting prey to the Saracens from Sicily. It was conquered by Roger of Sicily in 1130, and then became a kingdom.

The Norman kingdom of Naples and Sicily, which included all S. Italy, held as a fief of the Holy See, passed through Constance, the

Norman heiress, to the Hohenstaufen line. The emperor Frederick II was succeeded in the Two Sicilies, as the kingdom was called, by his illegitimate son, Manfred. The pope, however, offered the inheritance of Naples to Charles of Anjou, by whom Manfred was defeated and slain at Benevento, 1266.

The Angevins continued to hold the kingdom of Naples after the Sicilian Vespers had ousted them from Sicily. The dynasty died out with Joanna II, whose evil life still remains a byword. Alfonso V, king of Aragon and Sicily, whom she had once adopted as heir, seized the kingdom upon her death, 1435. After a long struggle with the French, he was acknowledged king of the Two Sicilies in 1443, and bequeathed his Neapolitan kingdom to his cruel and avaricious bastard, Ferrante, or Ferdinand, 1458.

#### French and Spanish Struggles

Joanna I, having no issue, had finally adopted her cousin Louis, duke of Anjou. His rights, passing to Louis XI and Charles VIII of France, formed the pretext for the French invasion of Italy. Charles VIII occupied Naples Feb.-May, 1495. When the French were expelled from Italy, the Aragonese returned to Naples. But Louis XII joined with Ferdinand of Spain against his kinsman Frederick, took and sacked the capital. They fell out over the spoils. Thereupon the Spanish general, Gonzalo de Cordova, ejected the French after the battle of the Garigliano, 1503, and Naples became henceforth a Spanish province.

Before the battle of Lepanto, 1571, restored Spanish supremacy in the Mediterranean, Naples suffered much from raids by the Turks. In 1647 occurred the revolt of Masaniello. Another rising, under Gennaro Annese, was ruthlessly suppressed by Don John of Austria, to whom Gennaro betrayed the city, after the duke of Guise had come, at his invitation, to regain the possessions of the House of Anjou. By the war of the Spanish Succession, Naples, wrested from Spain, passed to the Austrian Emperor, Charles VI, in 1713. But during the war of the Polish Succession, Don Carlos, second son of the Bourbon Philip of Spain, invaded the Two Sicilies, and by the treaty of Vienna, 1738, was recognized as King Charles II. Under the Spanish Bourbons, Naples remained in a state of medieval barbarism. The people were oppressed, poor, ignorant, and lazy; the city teemed with *lazzaroni*, the country with bandits, beggars, and priests. An at-

tempt by Ferdinand IV to expel the French Republican armies from the Papal States was followed by the creation of the Parthenopean Republic in Jan., 1799.

#### Bourbon Restoration

Ferdinand was restored next year by a Calabrian army under Cardinal Ruffo, supported by the British fleet, and even after Marengio, thanks to the intervention of Paul I of Russia, he was still allowed to reign. Napoleon, however, turned out the Bourbons in 1806, and made first his brother Joseph, and then his general, Joachim Murat, king of the Two Sicilies, 1808. Murat, in spite of Napoleon's military and financial exactions, introduced some reforms before he attempted to lead a revolt in favour of Napoleon, and was forced to flee, May, 1815.

Ferdinand IV, returning as Ferdinand I, king of the Two Sicilies, gave fair promises of freedom and reform, while secretly binding himself to Austria not to introduce constitutional changes other than those allowed in the Austrian dominions in Italy. The administration remained corrupt and oppressive as ever. A military rising in 1820, joined by the members of the Carbonari (q.v.), and led by General Pepe, wrung the concession of a constitution from the treacherous tyrant; but the Bourbon absolutism was restored by Austrian bayonets. This oppressive and despotic government was continued by Francis I and Ferdinand II, nicknamed Bomba, who quelled a rebellion in 1828, and in Jan., 1848, yielding to a series of revolutionary outbreaks, granted a constitution. But after a period of wild disorder, the constitution ended in a massacre, May 15, 1848. Ferdinand took ferocious vengeance upon the champions of liberty, which called forth the denunciations of Gladstone, and was checked by British intervention.

At length the emancipation of Italy put an end to Bourbon misgovernment. Garibaldi, landing in Sicily, made his way to the capital, whence Francis II had fled, Sept. 8, 1860. Disregarding the Mazzinian democrats, he hailed Victor Emmanuel as king of Italy, and the people of Naples and Sicily voted themselves a part of the Sardinian kingdom, Oct. 21.

**Bibliography.** History of the Kingdom of Naples, 1734-1825, P. Colletta, 1860; History of Sicily from the Earliest Times, E. A. Freeman, 1891; Naples in 1799, C. H. D. Giglioli, 1903; Napoleonic Empire in S. Italy, R. M. Johnston, 1904; Naples, Cecil Headlam, 1927; Garibaldi, G. M. Trevelyan, 1933.

**Naples, BAY OF.** Semi-circular opening of the Mediterranean Sea, on the S.W. coast of Italy. Its maximum width is 20 m. between the capes of Miseno on the N. and Campanella on the S. It is backed by Mt. Vesuvius and Monte Sant' Angelo, and on its shores lie the towns of Sorrento, Castellamare, Pozzuoli, Torre del Greco, and Portici, besides the city of Naples. Off the N. extremity of the bay are the islands of Ischia and Procida, and on the S. is Capri.

**Naples Yellow.** Yellow pigment consisting essentially of lead antimonate. The shade depends on the proportion of lead oxide. Compounds of this type have long been used for colouring pottery and glass, e.g. 13th cent. Persian pottery, Babylonian tiles c. 600 B.C.

**Napo.** Large river of S. America. A tributary of the Amazon, it rises N. of the volcano Cotopaxi in Ecuador, and flows generally E.S.E. Near Huiririma it passes

into Peru—the boundary is disputed—and it falls into the Amazon some 50 m. below Iquitos. Its course is about 750 m., nearly 400 m. of which are navigable. Its important affluents include the Coca, Aguarico, and the Curaray. The town of Napo stands on its banks.

**Napoleon.** French gold coin. It was first issued by the great emperor, hence its name. Its

Napoleon. Obverse and reverse of gold coin of Napoleon III.  $\frac{2}{3}$  actual size

value was 20 francs, nominally 15s. 10d., and its weight 6.45 grammes. It replaced the louis d'or and is now obsolete. See Louis

armada seized Malta. Sailing thence, and evading Nelson's pursuit, he landed near Alexandria, took that city by storm, and overthrew the Mamelukes at the battle of the Pyramids.

#### Battle of the Nile

The occupation of Cairo without resistance completed his triumph, and he set to work, with Roman ingenuity and thoroughness, to organize his conquest. In the Institute of Egypt, divided according to subjects, he applied the energies of the French *savants*, whom he brought with him, to the task of exploring Egypt, developing its resources, and beginning a revival of learning. The discovery of the Rosetta Stone and many other relics of the age of the Pharaohs shed distinction on the whole enterprise and stamped it with the originality of Napoleon's genius. But Nelson shore asunder the scheme of a French Oriental empire. At the battle of the Nile, Aug. 1, 1798, he annihilated the French fleet and cut off Bonaparte from communication with France, but Napoleon succeeded in evading the British cruisers and landed in the south of France on Oct. 9, 1799, when the failure of his enterprise was still unknown, and the perils of an Austrian invasion roused discontent with the Directory.

Napoleon accordingly found it easy to concert with Talleyrand, Murat, and Lucien Bonaparte in the overthrow of the Directory. On the ruins he and his friends constructed a strongly personal system in which he, as first consul, held all the executive and much legislative power. But the new personal government ended the strife of factions, and effected much-needed changes by reconciling all but the irreconcilable royalists, by undertaking useful public works, by initiating the codification of French law, and by healing the schism in the Church by what was known as the concordat of April 18, 1802. He thus earned the title of the restorer of the altars, while he restored the prestige of French arms by his brilliant passage of the Alps, and the victory of Marengo. Britain, also, was fain to come to terms in the treaty of Amiens, March 23, 1803.

By instituting prefects in every department Bonaparte curbed democratic local government; while his foundation of the legion of honour paved the way for the subsequent restoration of an order of nobility. Other institutions due to his organizing genius were the bank and university of France.

The vain attempt of the royalists to foment a plot against his life, early in 1804, was cleverly

## NAPOLEON BONAPARTE

J. Holland Rose, Litt.D., Author of *The Life of Napoleon*

*This sketch of the great Corsican is followed by an article on the Napoleonic Campaigns. Further information will be found in the articles Europe; France; French Revolution. See the article Bonaparte and those on Napoleon's marshals, e.g. Murat; Ney; Soult; also Josephine; Nile; Trafalgar, etc.*

Born at Ajaccio, Aug. 15, 1769, the second surviving son of Charles and Letizia Bonaparte (*née* Ramolino), Napoleon came of an Italian stock, long domiciled in Corsica. Sent to school at Brienne, in 1785 he became lieutenant in the La Fère artillery regiment, and in various garrison towns displayed zeal for the service. He passed much of his time on furlough in Corsica during the early period of the Revolution, and his studies of Rousseau disposed him to accept the new democratic doctrines. Long and confused struggles with the Paolist or monarchist faction in that island ended in his disaffection, and, with his family, long fatherless, he fled to France in June, 1793.

#### Royalist Rising of 1795

The new republic badly needed able officers, and the ability with which Napoleon organized and directed its artillery during the siege of royalist Toulon largely contributed to the recapture of that city. Though disgraced and imprisoned for a short time, after the fall of Robespierre, July, 1794, the young Jacobin regained his position in the army, and strengthened it during the campaign in the Italian Riviera. Another sharp setback to his fortunes failed to daunt him. His chance came in Sept., 1795, when the republic was confronted by a serious royalist rising

in Paris, which he helped to crush. Soon after, he was captivated by a fashionable young widow, Josephine de Beauharnais, whom he married.

#### The Italian Campaign

Napoleon then set out on his Italian campaign, in which he forced Sardinia to surrender, defeated a succession of Austrian armies, overran Tuscany, compelled the pope and the king of Naples to sue for peace, and then pushed back the Austrians and made the emperor a suppliant for terms. He crushed Venice and divided its territories between Austria and France. He began the Italian campaign an almost unknown general, received with murmurings by his subordinates. At the end of 1797 he had generals and troops absolutely at his disposal, he had ransacked the museums of Italy for their art treasures, which he sent to the Louvre, he had dictated terms to pope and emperor, and France acknowledged him as her greatest warrior.

The Directory at Paris urged him either to invade England or conquer the East. He chose the latter and secretly prepared a great armada. The military occupation of Rome and of the central cantons of Switzerland having provided part of the funds for the enterprise, he set sail from Toulon in May, 1798, with a large fleet. Strengthened by squadrons from Italy, the

countermined by him and his police; and the result was the capture of the chief plotters. The obsequious senate begged him to re-establish hereditary rule, in order "to defend public liberty, and maintain equality." In Aug., 1802, he had secured the consulate for life, with power to name his successor. On May 18, 1804, he became the emperor Napoleon I, and the coronation ceremony at Notre Dame on Dec. 2, at which the pope poured on the holy oil, showed that all the splendour and prestige of the old monarchy was to reappear. The last traces of the republican constitution soon vanished. These last successes of the autocrat were due to his military triumphs in the war which broke out, first with England, in May, 1803, and with Austria and Russia in the summer of 1805. The struggle with Britain in 1803-5 was entirely naval, ending at Trafalgar.

The years between 1805 and 1815 were passed mainly in warfare. Having received the surrender of Mack and 70,000 Austrians at Ulm, Napoleon occupied Vienna, and gained his greatest victory at Austerlitz. He then bestowed the title of king on some of his South German allies, declared the Holy Roman Empire at an end, and formed the confederation of the Rhine. Prussia rushed to arms in Sept., 1806, only to be utterly overthrown at Jena and Auerstädt, Oct. 14, 1806. When the tsar Alexander I came to her assistance, the Allies were completely routed at Friedland, June 14, 1807.

#### The Disaster of 1812

Master of Central and Western Europe, Napoleon now imposed his brother, Joseph, on the throne of Spain; Britain espoused the cause of the Portuguese and Spanish patriots, and, in the campaigns of 1808-13, Wellington struggled bravely against the armies hurled at him by Napoleon. Thenceforth the Russians and Germans took hope; and in 1812 Napoleon met with his great disaster in Russia.

The remainder of his story must be briefly told. In succession Prussia and Austria rose up against him, and the campaign of 1813 resulted in his expulsion from Germany. Wellington, with British, Spanish, and Portuguese troops, made swift progress in the S., while in the E. the masses of the Allies closed in on Paris. They occupied Paris, and his own marshals and generals finally compelled him to abdicate in favour of his son, Napoleon II, who never reigned. While the fallen emperor retired to Elba, the child and his

mother, Marie Louise of Austria, married to him after he had divorced Josephine at the close of 1810, came under the influence of the Hapsburg court.

The disputes of the powers over the spoils of conquest gave to Napoleon one more chance. He escaped from Elba in Feb., 1815, landed at Antibes, and in a few days entered Paris in triumph; his rival, Louis XVIII, fled into Belgium. But France was resolved to accept Napoleon only as a constitutional monarch, and the powers declared him an outlaw for disturbing the peace of Europe. The emperor's abdication followed Waterloo within a week, and his effort to escape to America having failed, he surrendered to the British government, which sent him to St. Helena.

His last years were spent there with a few chosen comrades, whom he entertained with his unfailing flow of conversation, often captious and querulous, but always brilliant. He also compiled *Memoirs* and *Notes* of much interest but of doubtful veracity. Quarrels with Sir Hudson Lowe were often pushed to unreal and undignified extremes.

#### Why Napoleon Failed

We are now able to see that amidst transcendent qualities there were mingled pettier traits—a devouring egotism, a hard view of life as a series of calculations and chances; above all a profound contempt for the average man, and a disbelief both in religion and in the higher possibilities of progress of the human race. His mechanical view of life, abundantly proved in Gourgaud's *Journal*, reveals the inner reason why he failed to rise to the full height of that unparalleled opportunity offered by the years that followed the French Revolution. On May 5, 1821, Napoleon died at St. Helena. In 1840 his remains were taken to France and laid in a magnificent tomb in the *Hôtel des Invalides*. See *Arcola*; *Cenis*; *Code Napoleon*; *Invalides*; *Longwood*.

**Napoleon II.** Title given by French imperialists to the only son of Napoleon I, better known as the duke of Reichstadt (q.v.).

**Napoleon III** (1808-73). Emperor of the French. Charles Louis Napoleon Bonaparte was born in

Napoleon III,  
French emperor

Paris, April 20, 1808, the third son of Louis Bonaparte, by Hortense, daughter of Josephine, and was thus nephew to Napoleon I.

On the fall of the empire Hortense took her sons into exile.

His elder brothers having died, the death of the duke of Reichstadt in 1832 made Charles Louis, or Louis Napoleon as he was now styled, head of the Bonapartes. Fostering the Napoleonic legend in France by a series of pamphlets and secret machinations, he organized a mutiny at Strasbourg in 1836, on the failure of which he fled to New York, only to return the following year to Switzerland. In 1838 he moved to London, and in 1840 risked a landing at Boulogne, but was arrested and sent to the fortress of Ham.

Making his escape from Ham in 1846, Louis Napoleon went to London, where he remained until the revolution of 1848. He then began to reap the fruits of his long years of conspiracy and propaganda. Elected a member of the republican assembly in June, he was elected president on Dec. 10 by a majority of five to one. On Dec. 2, 1851, he effected the *coup d'état*. From the 10 years' presidency conferred on him by plebiscite, it was an easy step to the imperial throne, which he ascended Dec. 1, 1852.

The following year Napoleon married Eugénie de Montijo, and established a court which has seldom been surpassed for its splendour and extravagance. He joined England in the Crimean War, 1854-56; he assisted Piedmont to turn the Austrians out of N. Italy in 1859, and gratified French ambition by obtaining Savoy and Nice. Meanwhile things were going from bad to worse. The enmity of the Roman Catholics after his interference in Italy, his failure to establish a Latin empire in Mexico, the increasing hostility of Bismarck, and the necessity of establishing the empire on a firmer foundation than that of popular applause, perplexed Napoleon, who behind his mask of inscrutability was weak and undecided. It was with half-hearted desperation that

 Emperor: above, Buonaparte; below, Napoleon

# **NAPOLEON BONAPARTE: PORTRAITS AND DEATH MASK OF THE EMPEROR**

he embarked on the Franco-Prussian War (*q.v.*). He joined his army July 28, 1870, but five weeks later came Sedan, his surrender to the Prussians, Sept. 2, and the end of the empire. Napoleon was taken to Wilhelmshöhe, where he remained until the end of the war, when he joined the empress and their son at Chislehurst in England. There he died, Jan. 9, 1873, and was buried at Farnborough.

Napoleon failed principally because of contradictions in his outlook. He hankered after reviving the glories of France associated with the name which had brought him popularity, the undying Napoleonic legend. Yet being humane, cultured, and a dilettante, he wanted to rule in peace as the

arbiter of Europe, his dynasty accepted on equal terms by the oldest royalties. His only son, who was known as the Prince Imperial, is noticed under Eugène. *See also* Eugénie.

## THE NAPOLEONIC CAMPAIGNS

*Supplementing the biography of Napoleon, this article gives an outline of the campaigns he directed. See also the articles on the various battles, e.g. Austerlitz; Friedland; Marengo; Waterloo; also Peninsular War*

Napoleon's first great campaign was in Italy in 1796. The W. and S. faces of the mountains of N. Italy marked the fronts of the opposing armies. On the W. face the armies neutralised each other, while the French army of Italy was extended along the mountains parallel to the coast between Nice and Genoa. In about an equality of numbers the allied Austrians and Sardinians held the passes. In one month Napoleon forced the Sardinians to a separate peace. He then pushed on against the Austrians and compelled them to make peace within the year, which left him conqueror of Italy. This great campaign was typical of his strategy: a well-thought-out plan, rapidly and ruthlessly carried out, his intentions veiled until the moment for execution, and then a swift and decisive blow.

On these lines 1798 saw his capture of Malta and his brilliant campaign in Egypt, but also the battle of the Nile, which cut him off from France. In 1799 he invaded Palestine, but was stopped at Acre by Sydney Smith. Sea-power defeated generalship, and, leaving his army behind him, he escaped to France.

Napoleon secretly collected an army in Switzerland, crossed the St. Bernard, and severed the Austrian communications. Melas, the Austrian commander-in-chief, on hearing of this blow, delayed for the surrender of Genoa, then fought at Marengo with his front towards Austria, was defeated, and surrendered with his whole army,

June 14, 1800, so that for the second time in five years Napoleon conquered Italy.

War broke out again in 1803 with Great Britain, whose government, by 1805, had built up a coalition with Russia and Austria. Napoleon had been ostensibly preparing to invade England, but he could never obtain the necessary uninterrupted command of the Channel. On Aug. 25, 1805, he decided to transfer the army to the Rhine, rapidly passed the Black Forest, and, before Mack in Ulm could be joined by the Russians, or realize his danger, he found himself surrounded, and capitulated with his whole army the day before Trafalgar. Napoleon followed up Ulm with the campaign of Austerlitz, where he defeated the Austrians and Russians on Dec. 2. The treaty of Pressburg, Jan. 1, 1806, forced Austria away from the second coalition.

Prussia had been hesitating whether to join the coalition, and, too late for success, on Oct. 1, 1806, she declared war. On Oct. 14 she was defeated at Jena and Auerstädt; on the 25th the French entered Berlin, and Prussia lay at Napoleon's feet. This might be considered the summit of his irresistible success. He had conquered Italy and Germany; Switzerland and Holland were in his hands; but England's sea-power set a limit to his European and Asiatic schemes of conquest. He had paralysed the older school of Austrian and German generals by his strategy and tactics.

The king of Prussia, though the greater half of his kingdom was in Napoleon's hands, did not sue for peace, and Sweden and Russia helped to carry on the struggle. The battle of Eylau, Feb. 7-8, 1807, has been claimed as a Napoleonic victory, but it was fiercely contested, and the French losses were equal to the Russian. At Friedland, June 14, Napoleon defeated Bennigsen.

### The Peninsular War

The Peninsular War, undoubtedly a beginning of his downfall, can only for a brief period be styled a Napoleonic campaign. In Nov., 1808, he defeated the Spanish insurgents in a decisive action, entered Madrid, Dec. 4, and then turned against Sir John Moore, who had ventured into the heart of Spain with 25,000 men. His retreat began in time to avoid Napoleon's overwhelming force, and the emperor, thinking the matter negligible, left the pursuit to Soult, Jan. 1, 1809, and turned his attention to Austria. Until Waterloo, Napoleon himself never met a British force, and never defeated one in a pitched battle.

The Austrians had been humiliated after Austerlitz, and awaited an opportunity for revenge. The archduke Charles took the field in April, 1809, and crossing the Inn between Braunau and Passau, got in between the French marshals, and had a great opportunity of crushing either wing, but the necessary rapidity of execution was still lacking in Austrian strategy. Napoleon took over the command on April 17 and defeated the archduke at Eckmühl on the 22nd. He pushed along the right bank of the Danube to Vienna, and then suffered his first real defeat at Aspern, or Essling, in an attempt to cross the Danube by the island of Lobau. Withdrawing to the island with heavy loss, he refused to retreat and, calling up every available man, badly defeated the Austrians at Wagram (July 5-6) and forced them to another peace.

From this campaign until 1812 Napoleon did not personally take the field. The Spanish War was left to his marshals, who were not equal to Wellington in generalship. But in 1812 he had decided on the conquest of Russia, and by the middle of June he had assembled on the banks of the Niemen an army of 363,000 men, of whom only one-third were French.

On June 24, he moved on Vilna, but the Russians fell back before him, and the grand army began its sufferings from heat and

**cholera.** Smolensk was taken with loss on Aug. 16-17. Napoleon hesitated as to postponing his victory till the next year, but his former sound judgements were becoming dimmed by his belief in his own infallibility, so he pushed on, and on Sept. 7 fought the sanguinary battle of the Borodino. It was not decisive, but the Russians left the road to Moscow clear, and Napoleon entered that city on Sept. 14, only to be welcomed by a three days' fire which laid the deserted city in ruins. He began the retreat on Oct. 19 with 115,000 men. Forced by pressure from the S., he was obliged to retreat by his line of advance, already denuded of supplies, and his army perished from hunger and cold. The crossing of the Beresina on Nov. 27-28 completed the disaster.

By supreme efforts Napoleon raised another army by March, 1813, and moved it to the Elbe. The Russians, now joined by the Prussians, had moved into Germany, the combined army being under Wittgenstein. Napoleon assumed command on April 25 at Erfurt, and as usual decided to attack. At Lützen, May 2, Wittgenstein began an attack on the French advanced guard, while he directed the bulk of his forces against Napoleon's right and rear. This turning movement was detected and repulsed by Napoleon.

At Bautzen, May 21-22, he again drove back Wittgenstein, but without conspicuous success; and immediately after concluded an armistice more to the Allied advantage than to his own. In the autumn campaign, he had to face a far stronger combination of Austrians and Swedes, in addition to the now reinforced Russians and Prussians. Undaunted, he would not fall back on France, but, making his headquarters at Dresden, where he defeated Schwarzenberg on Aug. 27, he decided to defend the line of the Elbe, undoubtedly a strategical mistake. His men were not fit to carry out his plans, and his plans were not so clear as they used to be; and in the "battle of the nations" at Leipzig, Oct. 15-18, he was defeated.

Wellington was bringing pressure from the S.; each conquered nation in turn, as it escaped from Napoleon's grasp, added its quota to his foes; and the fighting in Champagne in 1814 was the despairing effort of the lion at bay. In many ways it was one of his finest efforts. Schwarzenberg was advancing from Basel, and Blücher on the line of the Moselle, each

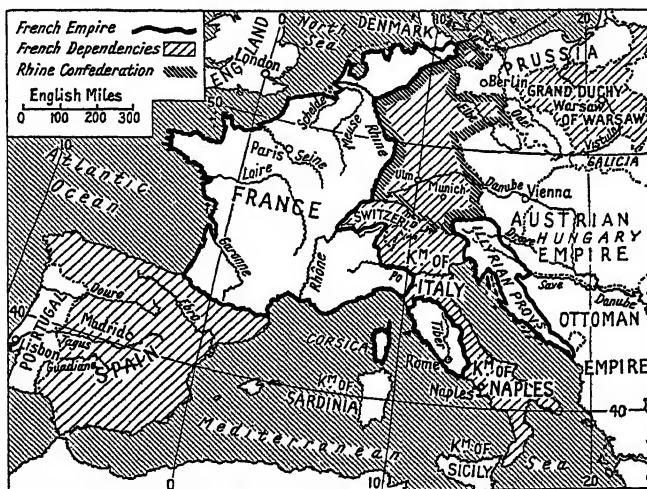

with an army superior in numbers to Napoleon's; while Bülow and Winzingerode were threatening from the N., Wellington from the Pyrenees, and Murat from Italy. Generally, Blücher's advance on Paris was along the Marne, while Schwarzenberg moved down the Seine, and Napoleon made superb use of these converging rivers.

Leaving his marshals to hold the crossings, he kept his main body between them, and came to the assistance of the side most immediately threatened. Thus he drove back Blücher from Brienne, Jan. 29, defeated him at La Ferté on the Marne, Feb. 11, and again at

Corsica, near Ajaccio, it has an orbicular structure which makes it, when cut and polished, a beautiful ornamental stone. From many points radiate concentric rings of dark and light coloured stone, the light consisting of feldspar and the dark of hornblende.

**Napo Pastaza.** Prov. of Ecuador, formed in 1925 by the division of Oriente (q.v.) region.

**Nappe.** In geology, a large recumbent fold of rock which has been driven more or less horizontally forward along a thrust plane. In the Alps such sheared recumbent folds occur one above another, and erosion has carved

Napoleonic Campaigns. Map showing the boundaries of the European states in 1812, as arranged by Napoleon

Vauxchamps, Feb. 14, and so stopped his direct line of advance on Paris, but Winzingerode was now at Soissons. Napoleon turned S. and drove Schwarzenberg, whose advance had reached Mormant, to the left bank of the Seine, Feb. 17, and towards Troyes. Napoleon then moved to meet Blücher on the Marne, and, driving him N. to Laon, defeated his left wing at Reims, March 13. Schwarzenberg, with Blücher, moved on Paris, which capitulated March 29.

In 1815 Napoleon had again raised a French army to defy Europe. With his usual rapidity, he defeated the unprepared Prussians at Ligny, June 16, but Ney failed to drive Wellington's advanced guard from Quatre Bras, and the obstinate Blücher, instead of retreating E. on Liège, moved N. to Wellington on the field of Waterloo.

**Napoleonite** or **Corstite.** In mineralogy, a variety of diorite. So called from its occurrence in

the valleys and peaks out of the pile so built up. See Fault; Fold.

**Naramsin.** King of Akkad, N. Babylonia. Neo-Babylonian tradition made him son and successor of Sargon I; Nabonidus's record that Naramsin's foundation inscription, unearthed at Sippara about 550 B.C., had been hidden for 3,200 years, would date his reign 3750 B.C. Some scholars consider this to be 1,000 years too early, and inscriptions prove that several other kings succeeded Sargon before Naramsin's reign. His victory stela from Susa is a supreme example of early Mesopotamian art. See Babylonia.

**Narasinha** or **Narsingh.** In Hindu mythology, one of the nine incarnations of Vishnu (q.v.). He appeared in the form of a man with the head and paws of a lion.

**Narayanganj.** Town of Pakistan, in the Dacca dist. of E. Bengal. It is a rly. terminus S.E. of Dacca on the Dhaleswari,

distributary of the Brahmaputra, and is a centre for the traffic in rice and jute. Pop. 56,000.

**Narbada** OR NERBUDDA. River of the N. Deccan, India. It rises near Mt. Amarkantak in the Maikal range, the E. end of the Satpura Mts., and flows almost due W. between the Satpuras and the Vindhya Mts. Its mouth is in the Gulf of Cambay, an inlet of the Arabian Sea. It is 800 m. long. Near Jubbulpore the river winds in a gorge between cliffs of white marble, the noted Marble Rocks.

**Narberth.** Town of Pembroke-shire, Wales. About 19 m. S.W. of Carmarthen, and 9½ m. N.W. of Tenby, it has a rly. station. It has fragments of a 13th century castle dismantled by Parliamentarians after unsuccessful defence by Royalists in the Civil War. The parish church has a quasi-fortified tower. Pop. 1,046.

psychological condition in which an individual's love remains concentrated on himself.

**Narcissus.** Small genus of bulbous herbs of the family Amaryllidaceae. They are natives of Europe, N. Africa, N. and W. Asia. One species only, the daffodil (*N. pseudonarcissus*), is indigenous in Britain, though the jonquil (*N. biflorus*) and the pheasant's-eye (*N. poeticus*), escaped from gardens, have become naturalised here and there. The rush-like or strap-shaped leaves all spring directly from the bulb, and the flowers are borne on tall scapes, either singly, as in the daffodil, or forming an umbel, as in the polyanthus narcissus (*N. tazetta*). There are numerous garden variations and hybrids in existence.

For bedding purposes vast numbers of the bulbs in a resting state are imported from the bulb-

**Narcissus.** Left, flowers of pheasant's-eye, *N. poeticus*; right, polyanthus narcissus, *N. tazetta*

**Narbonne.** City of France. In the dept. of Aude, it is 93 m. E. of Toulouse, and is connected with the Mediterranean by a canal about 5 miles long. In Roman days it was known as Narbo, and was the metropolis of Southern Gaul. In the 12th cent. a commercial rival to Marscilles, it produces a well-known red wine and a famous honey, and has also salt, sulphur, and porcelain works. The Gothic church of S. Just, with a lofty choir, was formerly a cathedral. Narbonne, occupied by the Germans during the Second Great War, in Nov., 1942, was liberated by French troops on Aug. 31, 1944, in a spectacular advance from the Rhône. Pop. 29,975.

**Narcissus.** In Greek mythology, a beautiful youth, beloved of the nymph Echo, whose passion he could not return. Echo died of grief, and as a punishment the gods caused Narcissus to fall in love with his own reflection in a spring and pine to death. He has given his name to narcissism, a

farms of Holland; and great quantities of cut flowers are sent from the Scilly Isles. The bulbs should be planted as early as possible in the autumn, to allow of the full development of roots before winter. They are not particular as to soil, but will succeed best in a deep loam, especially if a layer of sand is placed beneath each bulb at the time of planting. See Amaryllidaceae; Corona.

**Narcolepsy** (Gr. *narkē*, numbness). Condition in which a patient suffers from "attacks" of sleep, though he is often wide awake at night. The cause is unknown, and there is no successful treatment.

**Narcotics** (Gr. *narkē*, numbness). Term used in more than one sense, but generally to describe drugs which produce analgesia or abolish pain. They include opium, morphia, and diamorphine (heroin). The action of a narcotic drug differs from that of an anaesthetic in that pain is relieved before sleep or unconsciousness occurs. See Anaesthesia; Drug; Hypnotic.

**Narcotine** (Gr. *narkē*, numbness). Alkaloid of opium. First prepared by Derosne of Paris, in 1803, it occurs in opium in an amount varying from one to ten p.c., and is obtained as a by-product in the manufacture of morphine. Narcotine has little narcotic action, and is not now used in medicine.

**Nardò.** City of Italy, in the prov. of Lecce, Apulia. Situated 11 m. by rly. W. of Zollino, a junction on the Gallipoli line, it has a cathedral and many churches. Its main industry is textiles. Near the city are olive plantations and vineyards. Pop. 14,000.

**Nardoo** (*Marsilea drummondii*). Aquatic flowerless herb of the family Marsileaceae. It is a native of Australia. One of the water-fern group, it has a creeping root-stock, and its fronds take the form of a long, erect stalk, with four leaflets at the summit, arranged crosswise, and sensitive to light. The spore capsules are of two kinds: one containing a single macrospore, the other numerous microspores. They are contained at first in hard shells known as sporocarps, which the aborigines pound into a kind of flour.

**Narenta** (Slav. *Neretva*). River of Yugoslavia. It rises near the border of Montenegro, flows N.W. nearly to Ostrožac, and then S. through the largest valley from the Dinaric Alps to the Adriatic Sea past Mostar. The valley provides a comparatively easy route from the Adriatic coast to Sarajevo. A rly. follows the valley to Konjic. Of the total course of 140 m. only 10 m. are navigable.

**Nares, OWEN RAMSAY** (1888-1943). British actor. Grandson of W. R. Beverley, scene painter, he

was born Aug. 11, 1888, at Maiden Erlegh, Berks, and educated at Reading. He first appeared on the professional stage at the Haymarket Theatre, London, in Her Father, 1908. Among his earlier parts were Karl in Old Heidelberg, the title-role in Peter Ibbetson, Gavin Dishart in The Little Minister, and the clergyman in Romance. A handsome appearance and polished style made him one of the most popular actors of his day, though it took him some years to establish his reputation as something more than a "matinée idol." Later plays included If Winter

**Owen Nares,**  
British actor

Comes, 1923; *The Fanatics*, 1927; *Call it a Day*, 1935; *Robert's Wife*, 1937; *Rebecca*, 1939. Nares acted in numerous films from 1913 onwards. He died at Brecon, after touring military camps, July 31, 1943.

**Narew.** River of N. Poland. It rises in the forest of Bielowiez, N. of Pruzhany, and after flowing W. and S.W. across the plains for some 200 m., joins the Bug at Serock, 18 m. N. of Warsaw. The combined streams then run W. 20 m. to join the Vistula at Nowy Dwor. When the Germans launched their offensive against the Russians in the First Great War in July, 1915, the Narew formed the main line of defences screening Warsaw against Hindenburg's advance. After prolonged and bitter fighting, the Germans crossed on Aug. 15, but Warsaw had fallen already. After the German invasion of Poland in 1939, the Polish army was forced back to a line formed by the Narew, Vistula, and San, and the German advance was temporarily held by the fortress of Modlin. German troops forced a crossing of the Narew N.E. of Warsaw, which fell on Sept. 27. The Narew was again the scene of heavy fighting when it was crossed by the Russians in the autumn of 1944. Poland's 1945 frontier left its upper reaches in Russia.

**Nariño.** Maritime dept. of S. Colombia, S. America. It is bounded N. by Cauca dept. and S. by Ecuador. Although traversed by the Andes, it has many fertile tracts, yielding sugar, cocoa, rice, potatoes, and cereals. Stock raising is a prominent industry, and gold is mined. Manufactures include Panama hats and footwear. Over 500 m. of rly. serve the dept., which has many good roads. The capital is Pasto (*q.v.*). Area, 11,553 sq. m. Pop. 465,868.

**Nariño, ANTONIO** (1765-1823). Colombian statesman. He was born at Santa Fé, and as a young man incurred the displeasure of the authorities by translating into Spanish the decree of the French assembly concerning the rights of man and citizenship. After spending some time in Europe, he returned to Colombia and took part in the rising against Spain. For a short time in 1811, and again in 1812, he was dictator. In an ensuing civil war he was defeated and sent in 1814 to Spain, where he remained in prison until 1820. He died at Leiva, Dec. 13, 1823.

**Narni.** City of Italy, in the prov. of Terni. It stands on the Nera, the ancient Nar, 66 m. by

rly. N. of Rome. Picturesquely situated on a rocky eminence, 1,000 ft. alt., with an ancient

Narni, Italy. Piazza Priora, with the 11th century cathedral on the left; right, facade of the 14th century town hall

castle, now used as a prison, it has a cathedral dating from the 11th century. There are mineral springs in the vicinity. A trade is carried on in chemicals and indiarubber goods. Roman remains include a remarkable bridge built by Augustus, and an aqueduct that brought water from a spring 15 m. distant. A medieval bridge was destroyed by the Germans in the Second Great War, in which Narni fell to the British on June 13, 1944. The ancient Nequinum, or Narnia, it has been a bishop's see from 369. Pop. 14,000.

**Naroch.** Lake of White Russia S.S.R. It is 80 m. S.S.E. of Daugavpils, Latvia, and is drained by the river Naroch. In the First Great War the ground between lakes Naroch and Vishniev was the scene of heavy fighting in March and April, 1916. After early German successes, Russian reserves made a flank attack, causing a general withdrawal by the enemy. The territory was seized by the Poles from the Bolsheviks in 1921, and incorporated in the U.S.S.R. after the Second Great War.

**Narragansett Bay.** Inlet on the S.E. coast of Rhode Island, U.S.A. It extends inland to the mouth of Providence river, a distance of 25 m., and is from 4 m. to 8 m. broad. It contains several islands, among them Conanicut, which forms the lower portion into two channels, Prudence Island, and Rhode Island, which separates it from Sakonnet river.

Providence stands at its head, Newport on its E. shores, and Narragansett Pier, a fashionable seaside resort, below its entrance on the opposite side to Newport.

**Narrows, THE.** Name given to the narrowest portion of the Dardanelles Strait. It is less than a mile wide between Kilid Bahr and Chanak. See Dardanelles, Attacks on the.

**Narses** (c. 474-568). General and administrator under the Roman emperor Justinian. A Persian eunuch, he rose to high position at court, and for some time shared the command in Italy with Belisarius. His own military triumphs included a series of victories over the Goths, Alamanni, and Franks, as a result of which Italy was recovered as a province of the empire, governed by Narses himself from Ravenna. His administration, however, was harsh, and in consequence of a deputation, sent to Justinian to complain, Narses was recalled. In revenge he intrigued with the Lombards. See Byzantine Empire.

**Narsinghgarh.** Indian town and former state, until 1947 in the Central Agency, now part of Rajasthan. The state, founded in 1681, occupied part of the N. slopes of the Vindhya Mts., with an area of 731 sq. m. Pop. 125,178. The town lies 20 m. N.W. of Bhopal. Pop. 11,036.

**Narsinghpur.** A former Indian state now merged in Orissa. Founded 1292, and established by treaty in 1803, it is situated N. of the Mahanadi and S. of the eastern detached portion of Angul; it was one of the Orissa feudatory states. The raja resided at the village of Narsinghpur. Area, 199 sq. m. Pop. state, 50,000.

**Narthex.** In early Christian architecture, the vestibule or porch of a basilica. It is within the main entrance at the opposite end to the altar and sanctuary. It was originally used to accommodate Christian converts who had not passed the stage of initiation. The term has been extended to all church vestibules, but the traditional type of narthex is a room as long as the width of nave and aisles combined, with doors leading into the latter, and others to the atrium or outer court. See Basilica; Cathedral.

**Narva.** Town of Estonia S.S.R. It is 75 m. W. of Leningrad, and stands on the Narva, 7 m. from its mouth in the gulf of Finland. It is connected with Leningrad by rly. The buildings include the

Narva, Estonia S.S.R. View of the cotton mills, a main industry, on the bank of the River Narva

cathedral, the town hall, and the arsenal. The industries are tanning, flax, cloth and cotton mills, and the making of rope. The fishing is important. Founded in the 13th century, Narva was the property of Denmark and the Teutonic Order before passing to Sweden. The Swedes improved its fortifications, and in 1700 it was besieged, in vain, by the Russians. In 1704, however, Peter the Great captured it, and it was part of Russia until the state of Estonia was formed after the First Great War. The Russians erected a fortress called Ivangorod, on the other side of the river, but it fell into disuse. Pop. 25,000.

The battle of Narva was fought between the Russians and the Swedes, Nov. 30, 1700. The Russians were besieging the fortress, then in the possession of the Swedes, when Charles XII advanced to its relief. Peter the Great himself did not await his formidable foe, but fled to Novgorod. The Swedes, 8,000 strong, attacked the Russians behind their entrenchments, in a snowstorm, and in an hour had broken their left wing. Charles gained a decisive victory.

During the Second Great War, Narva was occupied by German troops in August, 1941, and captured by the Russians July 26, 1944.

**Narvik.** Seaport of Norway. It stands 75 m. from the sea on the almost land-locked Ofot fjord, a branch of the narrowing Westfjord. Above and below the port are the small but deep Rombaks and Herjangs fjords. The terminus of the rly. to Gellivare (g.v.) and Lulea (g.v.) in Sweden, and situated 30 m. N.N.E. of Pernitz, it has extensive quays and exports Swedish iron ore. Pop. 10,000.

**NARVIK IN THE SECOND GREAT WAR.** Narvik was essential to German war potential as the port for the iron ore of the Gellivara

and Kiruna mines. Sailing along a narrow corridor inside Norwegian territorial waters, the ore ships were virtually outside the British blockade. It was the German determination to ensure iron supplies from Narvik, and the British decision to terminate them, that precipitated Norway into the war.

On April 8, 1940, the Royal Navy laid minefields at the entrance to the West fjord and in the corridor used by the ore ships with the object of forcing them outside territorial waters. Next day Germany invaded Norway. In preparation for that event a 10,000-ton ship, the Norge, ostensibly a whale-oil tanker but actually a camouflaged German troopship, had put into Narvik two days earlier accompanied by several merchantmen. After some desultory fighting with the Norwegian garrison, the troops from the ships seized Narvik. Later in the day they were reinforced by a convoy of supply ships and transports escorted by six destroyers and a submarine. The passage of this convoy was opposed by two Norwegian coast-defence ships, both destroyed before they could seriously damage the enemy.

On the afternoon of April 9 the 2nd British destroyer flotilla, which, after covering the previous day's mine-laying, was on patrol at the entrance to West fjord, was ordered by the Admiralty to attack the enemy force in control of Narvik. The flotilla consisted of the Hardy, Hotspur, Hostile, Havoc, and Hunter, each mounting four 4.7-in. guns, and was commanded by Capt. Warburton-Lee. As the enemy vessels were all more heavily armed than the British and supported by newly-installed German shore batteries, Warburton-Lee signalled the Admiralty the superior German strength, but added that he intended to attack at dawn on April 10. The Admiralty placed on him the onus of deciding to attack or not.

At 4.30 a.m. on April 10, after a hazardous passage of the 60 m. long West fjord in a blinding snowstorm, the British flotilla stood outside Narvik, and the Hardy entered the harbour and opened fire with guns and torpedoes against the German transports and destroyers there. The rest of the British destroyers followed and a desperate action ensued. The Hardy was repeatedly hit by ship and shore batteries, and her commander was killed. Finally, a shell put her engines out of action and she was run aground. When the Hunter had also been sunk, and the Hotspur and the Hostile seriously damaged, the remaining destroyers withdrew. The enemy was in no condition to follow, having lost one destroyer sunk and three on fire, besides six supply ships sunk. Warburton-Lee received a posthumous V.C.

The surviving British ships then blockaded the port until April 13, when they were joined by the battleship Warspite and the des-

Narvik, Norway. Sketch map showing the sea approach to Narvik, scene of an historic twofold British naval action in the Second Great War

troysers Cossack, Eskimo, Punjabi, Bedouin, Foxhound, Forester, Kimberley, Icarus, and Hero. Supported by squadrons of the fleet air arm, the British force silenced the shore batteries, and after a four-hour battle sank the German destroyers in Narvik harbour. Naval parties then went ashore.

Although the Germans' seaward defences at Narvik had been destroyed, it was impossible for the Allies to hold the port unless they could advance from the land, as the surrounding districts were already in the hands of strongly entrenched enemy forces. The capture and occupation of Narvik depended, therefore, on the advance of the Allied military forces from Namsos, nearly 400 m. to the S. When the Allies were obliged to re-embark at Namsos, certain formations delayed by bad weather and impassable roads had reached the vicinity of Narvik, and on May 26 assembled on the N. shore of Rombaks fjord preparatory to an assault on Narvik.

Under covering fire from British warships, French and Polish troops crossed and established bridgeheads, whence Norwegian troops attacked the Germans entrenched on the mountains to the E., from where the town was to be forced. After heavy fighting, the enemy was cleared from his positions, but the advance was delayed by a devastating German air raid which laid much of the town in ruins.

At midnight on May 26 the Allies attacked the town and captured it after heavy losses. The fall of Narvik and the subsequent Allied advance along the rly. to the Swedish frontier promised to be a turning point in the Norwegian campaign; but the deterioration of the Allied situation in France and Flanders made imperative the withdrawal of the Allied forces from Narvik, which was evacuated on June 10 after the harbour installations had been destroyed. The evacuation of the port ended all organized resistance in Norway. *See* Norway; Second Great War. *Consult* The Invasion of Norway, H. Lehmkuhl, 1940.

**Narwhal** (*Monodon monoceros*). Cetacean belonging to the porpoise group. It inhabits the Arctic Ocean, and is distinguished by the spirally grooved, tapering tusk of the male, often over 7 ft. long, the animal itself being from 12 ft. to 15 ft. in length. The tusk usually

grows from the left upper jaw, and its fellow on the other side is rudimentary and does not protrude from the jaw, though specimens have been found with two long tusks. In other respects the narwhal has the general form of a small whale. Found in small schools of from 10 to 20 individuals, it is believed to feed upon cuttles, crustaceans, and small fish. Its oil and the fine ivory obtained from the tusk are valuable. *See* Whale.

**Nasal Index.** Number indicating the percentage ratio of the breadth to the length of the human nose. On the skull, the breadth is measured across the anterior orifice, the length measured from the junction of the nasal and frontal bones; on the living subject, the breadth is taken across the wings, the length from the root to the junction with the lips. Narrow noses, i.e. with nasal index below 47 (skull) or 70 (living subject), form the Leptorrhine group, including most Europeans, many N. Africans, and Rajputs. Medium noses, Mesorrhine group, 47-51 (70-85), are characteristic of American Indians and many Asiatics. Broad noses, Chamaerhine or Platyrrhine group, over 51 (85), characterise Africans S. of the Sahara, Melanesians, Negritos, and Negrells, Australian aborigines, etc. *See* Cephalic Index; Craniometry; Facial Angle; Man.

**Naseby, BATTLE OF.** Fought June 14, 1645, during the English Civil War. The king's cause was losing ground, and his army of 7,500 men was being followed by 13,000 parliamentarians under Fairfax and Cromwell from Davenry towards Leicester. At Broadmoor, just before entering Leicestershire, Charles decided to fight. His foes fell back and took up a position on some high ground just N. of Naseby, a village 7 m. from Market Harborough. Both

put to flight the opposing horsemen, whom they recklessly pursued towards Naseby. While the royalist infantry pushed the enemy back, the day was turned by Cromwell's troopers, who, after routing the horse opposed to them, fell upon the flank of the infantry. These were thrown into confusion, and the king, who was with the reserve, gave them the word to charge. But the earl of Carnwath, realizing the situation, seized the bridle of his horse and turned it from the field, the attendant troops quickly following this example. The parliamentary foot rallied, and, with Cromwell's horse, soon completed the victory. Rupert, returning from his pursuit, could do naught but follow Charles to Leicester. The royalists lost about 1,000 killed and 5,000 prisoners, and the king's private papers were also seized and afterwards published. *See* Charles I; Civil War, The.

**Nash, JOHN** (1752-1835). British architect. Born of Welsh stock, he was apprenticed to Sir Robert Taylor, and after abandoning architectural work retired to an estate near Carmarthen, but resumed his practice about 1793. By 1814 he had become favourite architect of the prince regent. It is with his share in London architectural improvements that his name is inseparably connected. He designed terraces along the edge of Regent's Park, adopting the design (previously evolved by the Adam brothers) of uniting several houses in a single façade, faced with stucco. Park Crescent and square, with Albany St. and other adjoining streets were also erected from his designs. After projecting the Regent's Canal, he designed Regent St., and All Souls' Church, Langham Place. Other London buildings included the Haymarket Theatre, Suffolk Galleries, United Services Club, E. wing of Carlton House Terrace, and the repairing and enlarging of Buckingham House (later Buckingham Palace), including the entrance archway which, removed in 1850-51 to

Narwhal. Male specimen with long, tapering tusk

armies were drawn up in similar formation, the foot in the centre, with cavalry on both flanks and a reserve behind.

The royalists opened the fight by crossing the intervening valley and charging up the hill. On one wing, with Rupert leading, they

Cumberland Gate, Hyde Park, became known as Marble Arch. Other important work consisted of alterations and additions to the Pavilion, Brighton. He retired about 1831 and died at E. Cowes Castle, Isle of Wight May 13, 1835. A study by J. Summerson appeared in 1935. *See* Architecture illus. p. 571 (No. 7); Marble Arch illus.; Regent Street.

**Nash, JOHN NORTHCOTE** (b. 1893). British painter. Younger brother of Paul Nash (*v.i.*), he was born in London, April 11, 1893, and educated at Wellington. In 1918 he was commissioned by the Imperial War Museum to paint war pictures. His early work was influenced by Cubism, but he later developed a naturalistic style, and became well known for landscapes and woodcuts. A member of the London Group (*q.v.*), he became assistant teacher of design at the R.C.A. in 1934. He is represented at the Tate gallery, the Victoria and Albert Museum, London, and provincial galleries.

**Nash, PAUL** (1889-1946). A British painter. He was born in London, May 11, 1889, and studied at the Slade School. His early work showed the influence of Blake and Rossetti in its visionary character, but about 1911 he exhibited small drawings of

gardens, trees, and ponds. During the First Great War he came into prominence with a collection of drawings and paintings of the Ypres salient, the most representative being *The Menin Road*, now in the Imperial War Museum. In the Second Great War he exhibited remarkable studies of smashed aircraft. Professor of design at the

R.C.A., 1924-25, he is represented at the British Museum, Tate gallery, Manchester art gallery, and Musée de la Guerre, Paris. His later work was notable for a meta-physical or apocalyptic quality owing something to the influence of Blake, but based on forms observed in natural history, *e.g.* shells, flints, fungi, in austere colour. He regularly exhibited with the London Group. He died July 11, 1946. His autobiography, *Outline*, was published in 1949.

**Nash, RICHARD** (1674-1762). English dandy known as Beau Nash. Born at Swansea, Oct. 18, 1674, the son of a successful glassmaker, he was educated at Carmarthen Grammar School and Jesus College, Oxford. He was for a brief time in the army, and then entered the Inner Temple, 1693. He, however, took to gambling and living by his wits. In 1705 he went to Bath, then beginning to be a fashionable resort, and set about organizing its attractions, coming to be regarded as the arbiter of affairs and titular master of the ceremonies. He died Feb. 3, 1762, and was buried in Bath Abbey. See *Life of Richard Nash*. O. Goldsmith, 1762.

**Nashe or NASH, THOMAS** (1567-1601). English satirist, playwright and critic. Born at Lowestoft, he was educated at St. John's College, Cambridge, graduating in 1586. After travel in France and Italy, he became a prominent figure in literary London, a friend of Greene, Lodge, Marlowe, and others. He took the anti-Puritan side in the Martin Marprelate controversy, engaged in a paper war with Gabriel Harvey (*cf.* his *Have with you to Saffron Walden*, 1596), completed Marlowe's *Tragedy of Dido*, 1594, and was imprisoned for several months in the Fleet on account of his suppressed comedy, *The Isle of Dogs*, 1597. His novelette, *The Unfortunate Traveller*, or

*The Life of Jacke Wilton*, 1594, started the Surrey and Geraldine legend, and forms a link between the picaresque fiction of Spain and the novels of Defoe and Smollett. His works have been edited by R. B. McKerrow, 4 vols., 1904-10.

**Nashua**. City of New Hampshire, U.S.A., one of the county seats of Hillsboro co., and the state's largest city. It stands on the Merrimac at its confluence with the Nashua, 15 m. S. of Manchester, and about 40 m. N.W. of Boston, and is served by the Boston and Maine rly. and an airport. Its varied industries include cotton goods, textiles, blankets, shoes, iron and steel products, hardware, asbestos, and paper products. Among the city's pioneer factories was one founded by the inventors of the first instruments for shearing and clipping animals and of barbers' clippers. One quarter of Nashua was destroyed by fire in 1930. Settled in 1655 it was incorporated as Dunstable in 1673, and received its present name in 1836, becoming a city in 1853. Pop. 32,927.

**Nashville**. Second largest city of Tennessee, U.S.A., the state capital, and the co. seat of David-

Nashville, Tennessee. The state capitol, built on a hill overlooking the town

son co. A port of entry, it stands on both banks of the Cumberland river, 185 m. S. by W. of Louisville, and is served by the Louisville and Nashville and other rlys., and by steamers, and an airport. It is in the midst of fertile country, producing cotton, tobacco, wheat and other grains, fruit, and livestock. Nashville itself is a leading commercial and industrial centre. A well-built city, its prominent buildings include the capitol, the Federal building, the city hall, and the court house. In the grounds of the capitol is the tomb of James Polk, 7th U.S. president.

Paul Nash. *The Pond*, an oil painting (1921-24) expressive of the artist's great interest in the decorative quality of trees

By courtesy of the Earl of Cranbrook

Here also is a national cemetery and a confederate cemetery; a R.C. cathedral; an art museum; the state library and historical museum; Vanderbilt university, and Fisk university for negroes. Settled in 1780 and formerly known as Nashboro, the city was incorporated under its present name in 1784, and became a city in 1806. In 1864 it was the scene of a fierce battle between the Tennessee army and the Federal forces. A national parkway (447 m.), following the old Indian trail between Nashville and Natchez, Miss., was under construction in 1948. About 10 m. E of Nashville is the Hermitage, the home of Andrew Jackson, a national shrine. Pop. 167,402 (one third negro).

**Nashville, BATTLE OF.** Federal victory in the American Civil War, Dec. 15-16, 1864. J. B. Hood, in command of the army of Tennessee 25,000 strong, was moving W. from Atlanta when he learned that a Federal army of some 55,000, under G. H. Thomas, was holding Nashville. Hood invested the town until, on Dec 15, Thomas opened the battle by a general attack. The day slightly favoured the Confederates. An attack on the Confederate right in the morning failed, but MacArthur, commanding the 16th Federal corps, pierced the Confederate left at the moment when Federal cavalry attacked them in the rear. The rout was complete, and Hood made his way across the Tennessee river with what was left of his army. Federal losses were 3,000; the Confederates lost 4,500 in prisoners, in addition to heavy casualties.

**Nasik.** District and town of Bombay state, India, in the Central division. The dist. lies N.E. from Bombay, E. of the W. Ghats. The rainfall is 29 ins. annually; two-thirds of the area is cultivable, but only 54 p.c. is cultivated. Native food grains and pulses are the chief crops.

The town is near the source of the Godavari river at the foot of the W. Ghats, and is consequently a sacred place of pilgrimage; temples and shrines line the river banks and dot the bed of the stream. Nasik is a great road centre on the rly. from Bombay to Delhi. It is famous for its brass and copper work, and cotton handloom weaving. Area, 5,922 sq. m. Pop. dist., 1,113,901; town, 42,756.

**Nasirabad.** Town of Bombay state, India, in the dist. of Kandesh East. On the rly. 2 m. S. of Bhadli, it manufactures glass bangles. Pop. 14,392.

**Nasmyth, ALEXANDER** (1758-1840). Scottish painter. Born at Edinburgh, Sept. 9, 1758, he

Alexander Nasmyth,  
Scottish painter  
After Nicholson

studied under Allan Ramsay in London, and in Italy. Settling at Edinburgh, he tried portrait painting, but abandoned it for landscape. He was a member of the Society of Scottish Artists, an associate of the Royal Institution, and occasionally exhibited at the R.A., London. He died April 10, 1840.

**Nasmyth, JAMES** (1808-90). British engineer. Born at Edinburgh, Aug. 19, 1808, he was educated at the High School, and soon became an adept in making models of steam and other engines. In 1834 he opened a foundry in Manchester, and, in partnership with H. Gaskell, worked up a prosperous business. In 1842 he patented the steam hammer by which his name is best known. His claim to this was disputed, as the French manufacturer Schneider had copied the design from Nasmyth's note-book and built one at his Creusot works before Nasmyth erected his in England. He invented various tools and mechanical appliances, and constructed a telescope to assist his astronomical studies. His observations were recorded in *The Moon considered as a Planet, a World, and a Satellite*, 1874, illustrated with photographs. He died May 7, 1890.

**Nasmyth, PATRICK OR PETER** (1787-1831). A British painter. Born at Edinburgh, he settled in

Patrick Nasmyth,  
British painter

London in 1807. On account of his imitation of the Dutch school, he was acclaimed as the Scottish Hobbema. He exhibited at the R.A. from 1809, and was an original member of the Society of British Artists. He died in Lambeth, Aug. 17, 1831.

**Nasr-ed-Din** (1829-96). Shah of Persia. He was born April 4, 1829, and succeeded to the throne, 1848.

He reached friendly relations with France and Russia; but his attempt to annex Herat (q.v.) brought him into conflict with Britain, 1856-57. A

Nasr-ed-Din,  
Shah of Persia

man of enlightenment and culture, his visits to Europe, 1873, 1878, and 1889, strengthened his endeavours to introduce reforms into Persia. Religious toleration, the telegraph, banking organization, and a post office were established, despite opposition. He was assassinated by a religious fanatic, May 1, 1896.

**Nassarawa.** Town of North Nigeria. It is situated on the Benue and is a centre of rubber and cotton production. The Fula tribe, who occupied the neighbourhood, surrendered to the British in 1902.

**Nassau.** An area of Germany once in the Prussian prov. of Hesse-Nassau. From it the family of Orange-Nassau took the title of count and duke. It was an independent state until 1866. Nassau lies between the Main and the Rhine, with the Lahn flowing through it. Its area is about 1,800 sq. m., and it had in 1866 nearly 500,000 inhabitants. It takes its name from the little town of Nassau on the Lahn, where the ruling family built their castle, but Wiesbaden was the capital.

The family of Nassau dates from about 1200. To a younger branch belonged William the Silent, and other princes of the house of Orange-Nassau. This became extinct when William III died in 1702, and its lands passed to a branch still in Nassau. This lost all its lands in 1806, but in 1815 its head, William, was made king of the Netherlands and grand duke of Luxemburg. His family, extinct in the male line in 1890, was represented in the female line by Wilhelmina, queen of the Netherlands.

The other branch of the family, having produced a German king in Adolf of Nassau (d. 1298), was divided into several lines. Two of these were made princes of the empire, and in 1806 Napoleon made them dukes. In 1816, having been granted the lands taken from the other branch of the family in 1806, Frederick William, as the

Nassau, New Providence. Courtyard of Government buildings in the capital of the Bahama Islands

result of a succession of deaths, became the sole ruler of Nassau. He called himself duke of Nassau, joined the German Confederation, and gave a constitution to his people. In 1866 the duke joined Austria in fighting against Prussia; consequently he lost his duchy. In 1890 the head of this family became grand duke of Luxemburg. See Netherlands; Orange.

**Nassau.** City, seaport, and chief town of New Providence (q.v.), and capital of the Bahama Islands, B.W.I. It stands on a declivity of the N.E. coast, has a sheltered harbour, wherein vessels drawing 16 ft. of water may anchor, and is defended by forts. Prominent buildings include government house, a cathedral, and other churches. It is a winter resort for invalids. It exports much local produce, including sponges, cotton, fruits, and salt. Founded by the English in 1629, it was almost destroyed by the Spaniards and French in 1703, but rebuilt in 1718, and fortified in 1740. In the American Civil War it was the headquarters of the blockade runners. Pop. 12,975.

**Nast, Thomas** (1840-1902). German-born American caricaturist. Born at Landau, Bavaria, Sept. 27, 1840, he was taken in 1846 to America. After drawing for Harper's Weekly and other journals, he went through the Garibaldi campaign in Italy, 1860-62, and the American Civil War. As a caricaturist, he proved a subtle and dangerous opponent of Tammany Hall. The Fight at Dame Europa's School, 1871, and the New York edition of the Pickwick Papers, 1873, were illustrated by him. He became American consul at Guayaquil in Ecuador, where he died, Dec. 7, 1902.

**Nasturtium.** Botanically, a genus of hardy cruciferous plants. Common garden nasturtiums are Indian cress (*Tropaeolum majus*), and canary creeper (*T. peregrinum*). See Indian Cress; Tropaeolum; Watercress.

**Natal.** One of the four provinces of the Union of South Africa. It has an area of 35,284 sq. m. (including Zululand, 10,427 sq. m.), and a pop. of 2,182,733, of whom 232,923 are European. The great majority of the white pop. is of British

extraction, but there are a number of Dutch and some German settlers. Of the various religious denominations the Anglican church has the most adherents, but the Dutch Reformed church, Presbyterians, and Methodists are also strong. Most of the 200,000 Indians in S. Africa live in Natal, almost entirely in the towns. Zululand, annexed in 1897, includes Tongaland; the districts of Vryheid, Utrecht, and part of Wakkerstroom, which are included in the so-called northern districts,

were transferred to Natal from the Transvaal in 1903. Pietermaritzburg is the seat of the provincial government, but Durban is the largest town, followed by Ladysmith, Dundee, Newcastle, Vryheid, and Greytown.

Natal lies in the extreme S.E. of Africa, and is bounded by the Cape Province and Basutoland on the S.W. and W.; by the Transvaal and Portuguese territory on the N.E. and N.; by the Orange Free State on the N.W., and by the Indian Ocean on the S.E. It has a seaboard of about 375 m., almost wholly without indentation. Of this, 165 m. belong to Natal proper, and the rest to Zululand. Its greatest length is about 250 m., and its greatest breadth about 200.

The province generally is mountainous, and near its border are some of the highest peaks of the Drakensberg range.

Natal arms

Natal. Map of the South African province covering an area of 35,284 sq. m., and showing the principal products and industries.

The ground rises rapidly from the coast in a succession of hills and ridges, between which are valleys in which the climate is tropical. The temperature falls as the higher parts of the country are reached, but everywhere it is warm. Malaria is found on the coast, but the province is practically free from consumption.

The highest mountains in Natal are Mont aux Sources (11,000 ft.), and other peaks of the Drakensberg range, many over 10,000 ft. high. The Biggarsberg is a spur of the Drakensberg. The chief river is the Tugela, which flows across the province from its source in the Drakensberg. Its main tributary is the Buffalo, which comes from another section of the Drakensberg, others being the Klip and the Mooi. Other rivers are the Umkomanzi, or gatherer of waters, a stream that, owing to its winding course, is 200 m. long, Umzimkulu with its tributary, the Ingangwana, and the Umgeni with its wonderful falls. The Pongola is a frontier river, which divides Natal from the Transvaal.

#### Natal and the Union

Natal is governed, as far as its internal affairs go, by a representative assembly and a small ministry responsible to it, on the accepted British model, except that its head, the administrator, is appointed by the Union government. This ministry looks after education, hospitals, etc., but most other matters are controlled by the Union authorities. It has a revenue from certain specified sources, and subsidies granted by the Union parliament. The franchise is practically confined to whites. In the house of assembly of the Union the province is represented by 17 members, while it sends eight to the Senate. The law is administered by magistrates in local courts and by judges on circuit. The highest court of the province sits at Pietermaritzburg, and from it there is a right of appeal to the supreme court of the Union at Bloemfontein.

The soil of the province is not very fertile and only about 12,000,000 acres are available for agricultural purposes. Coal is the most important mineral. Iron exists in large quantities, and in close proximity to the coal, while gold and other minerals are found. There are marble quarries near the mouth of the Umzimkulu. In Zululand gold reefs have been discovered, and there other minerals, including coal, exist. Timber is abundant, much being cut for

industrial purposes, and various kinds of tropical fruits abound in the warm regions near the coast, where also tea, sugar, coffee, and cotton are grown.

Many of the settlers devote their energies to the rearing of horses and cattle, although the rinderpest has proved a great drawback in this connexion. There are a large number of sheep and goats, many of these being owned by the natives, while ostriches, pigs, and poultry are bred. Of wild animals the larger ones, elephant, buffalo, and giraffe, have disappeared, and the lion and rhinoceros are found in only one area. Antelopes are still fairly plentiful, and there are some leopards and panthers. Birds and snakes abound.

The entrance to the province is at Durban, where steamers of the Union-Castle and other lines call regularly. From there the main line of rly. strikes across the country, passing by Pietermaritzburg, Ladysmith, and Newcastle, and after cutting the Drakensberg, enters the Transvaal. Two lines branch off from Durban along the coast, one to the N. and the other to the S., while two others go from Pietermaritzburg.

The country was discovered by Vasco da Gama on Christmas Day, 1497, and was therefore named Natal or Terra Natalis. Various mariners, both English and Dutch, put in here during the next three centuries, but the few attempts to make settlements were not successful. The native tribes were left almost to themselves until 1835, when one of the kings made a grant of land to the British and a colony was formed at Durban. The authorities in London, however, declined to proclaim the district a British colony.

#### Boers and British

In 1837 the first Boer settlers, coming through the Drakensberg, entered Natal. Almost at once they were attacked by the Zulus, and a struggle, in which some Britons took the side of the Boers, began. Finally, Dec. 16, 1838, after the British had been obliged to evacuate Durban, a large Zulu force was destroyed on the Umslato river, and the Boers secured possession of the country, entering Durban and founding Pietermaritzburg. They declared themselves a republic, but as they were technically British subjects, having come from Cape Colony, the British refused to admit independence. There was some fighting, but in 1843 Natal submitted and became a British colony.

In 1844 the country was added to the Cape of Good Hope, but in 1856 it was made a separate colony. In 1879 the Zulu war was fought out in the colony, and in the Boer war of 1900-2 some hard fighting took place on its borders. In 1893 it was granted responsible government, and in 1910 it joined the new Union of South Africa.

With the virtual closing of the Mediterranean and the loss of Singapore in the Second Great War, Durban became of first importance as a naval base, and formed a vital link in British and American communications with the Middle East. Natal units serving against the Axis forces included the Royal Natal Carabineers, the Natal Mounted Infantry, the Royal Durban Light Infantry, and units of the South African air force. See Abyssinia; N. Africa Campaign; S. Africa, Union of; Zululand.

*Bibliography.* Natalia: Exploration and Colonisation of Natal and Zululand, J. F. Ingram, 1897; Natal, the Land and its Story, R. Russell, 6th ed. 1900; A Lifetime in S. Africa, Sir J. Robinson, 1900; The Cradle Days of Natal, 1497-1845, G. Mackeurtan, 1930; Portrait of a Colony, A. F. Hattersley, 1940. Natal Province, Official Handbook, A. E. Tatlow, pub. annually, London and Durban.

**Natal.** Seaport of Brazil, and capital of the state of Rio Grande do Norte. It is the main airport for trans-Atlantic traffic from Europe to S. America. Situated on the Rio Grande near its mouth, 138 m. N. of Pernambuco, with which it is connected by rly., its harbour, formed by the estuary, is occasionally obstructed by sandbanks, which are dredged to admit vessels of 22 ft. draught. Cotton, sugar, leather, rubber, wax, and timber are exported. It was formerly known as Cidade dos Reis. Pop. est. 41,000.

**Natchez.** North American Indian tribe of Moskogan stock. In the 17th century they occupied nine villages in Mississippi. Their complex sun-worship, head-flattening, use of mounds as foundations of dwellings and temples, advanced pottery, and skilful weaving of mulberry-bark cloth perpetuated the culture of the mound-builders.

Early in the 18th century the Natchez and their allies entered upon a war with the French settlers, who had built a fort on their soil. In 1729 this fort was destroyed by the Indians, who killed the men and took the women and children prisoners. In return the French drove the tribe across the Mississippi into Louisiana

and partly destroyed them in Jan., 1731. The prisoners were sold as slaves to the W. Indian planters, and the remnant, after further fighting, joined other tribes. The few existing Natchez are found chiefly with the Cherokees. The name is perpetuated, not only in the city, but in Natchez Trace, a road constructed in 1801-02 from Nashville across the state of Mississippi to Natchez, about 500 m. away and under reconstruction as a national highway in 1948. See American Indians; Cherokee.

**Natchez.** City and seaport of Mississippi, U.S.A., the co. seat of Adams co. On the Mississippi river, 90 m. S.W. of Jackson, its commerce is riverborne; it is the only considerable U.S. town with no rly. service. A bridge linking it with Vidalia was opened 1940. There is a memorial park, and near the city a national cemetery. Industries include cotton-processing, and manufactures of clothing. Natchez occupies the site of a fort, built by the French, which passed to Great Britain in 1763. In 1779 the Spaniards secured it, and it was included in the U.S.A. in 1798. It was made a city in 1803. Pop. 15,296 (c. 50 p.c. negro).

**Nathan.** Biblical character. A prophet, he advised King David regarding the building of the Temple at Jerusalem, reproved him for the Bathsheba episode, and helped to secure the succession of Solomon.

**Nathan, HARRY LOUIS NATHAN,** 1ST BARON (b. 1889). British politician. Educated at S. Paul's School, he was Liberal M.P. for N.E. Bethnal Green, 1925-34, joining the Labour party in the latter year. Defeated in 1935 at Cardiff S., he was returned for Central Wandsworth two years later, and remained its member until raised to the peerage in 1940. After serving for some months as parliamentary under-secretary for war and vice-president of the army council, he was minister of civil aviation 1946-48, being made a privy councillor. Having acted from 1939 to 1943 as chief welfare officer first to the Eastern command, then to the London district, he retained the honorary rank of colonel. He was actively concerned with hospital work, being chairman of the Infants' Hospital, Westminster, and a governor of Westminster Hospital.

**Nathan, GEORGE JEAN** (b. 1882). American dramatic and literary critic. Born Feb. 14, 1882, he was educated at Cornell and Bologna universities, and joined

the staff of the New York Herald in 1905. Founder and editor (with H. L. Mencken) of *The American Mercury*, 1924-25, he was dramatic critic to *Vanity Fair*, 1930-38; *Life*, 1934-37; *Esquire*, 1935-46; *Scribner's*, 1937-39. Of his many publications the best-known include *The Critic* and *The Drama*, 1922; *Since Ibsen*, 1933; *The Entertainment of a Nation*, 1942, and an annual series of theatre books, the first of which was published in 1942.

**Nathanael.** Disciple of Jesus Christ. Practically nothing is known of him save that he came from Cana of Galilee (John 21, v. 2), and was brought to the Master by Philip (John 1, v. 45). Some scholars think he is identical with Bartholomew. The name, also spelled Nathaniel, means in Hebrew the gift of God.

**Natick.** Town of Massachusetts, U.S.A. In Middlesex co., it is 18 m. S.W. of Boston on the Charles river. It has a rly. station on the Boston and Albany rly. Manufactures include boots, shoes, clothing, etc.

**Nation, CARRIE AMELIA** (1846-1911). American temperance reformer. Born Nov. 25, 1846, she married David Nation, a lawyer and minister, in 1877. Her life was devoted to militant temperance activities, and she carried out a campaign of smashing public house fittings with an axe, frequently coming into conflict with the authorities. In 1908 she came to Great Britain to organize a similar campaign, but, receiving little support, returned to America the following year. She died June 11, 1911. *Consult* Carrie Nation, H. Asbury, 1930.

**National Anthem.** Musical composition with words, officially adopted for ceremonial use as an expression of loyalty to a national cause. National anthems are a comparatively modern notion, Great Britain's *God Save the King* (q.v.) being one of the earliest. This is said to have inspired Haydn to compose his *Emperor's Hymn*, which was the national anthem of Austria until 1918. This was in turn appropriated for the song *Deutschland, Deutschland über Alles*, written in 1848, which became the national anthem of Germany in 1919, superseding the imperial anthem, *Heil dir im Siegerkranz* (sung to the tune of *God Save the King*). *Deutschland* is one of several national anthems of which the words commemorate a particular event or period in the nation's history; others are the *Marseillaise* (q.v.), the *Braban-*

*çonne* (q.v.), and *The Star-Spangled Banner*, the anthems of France, Belgium, and the U.S.A. respectively, the last-named having been adopted as such in 1931. The national anthem of the U.S.S.R. was the *Internationale* until 1944, when a new one, composed by A. V. Alexandrov, was introduced.

During the first 21 months of the Second Great War, British listeners were able to hear a broadcast of the national anthems of an ever-increasing number of Allies played before the news every Sunday evening, until on the invasion of Russia the practice ceased on the plea of having become an absurdity. A complete list of national anthems, authors and composers, is given in *Everyman's Dictionary* of Music, ed. E. Blom, 1946.

**National Assembly.** Name taken by the body responsible for the opening stages of the French Revolution, and subsequently by other sovereign bodies in France, and elsewhere.

When the States-General met at Versailles in May, 1789, the three estates, nobles, clergy, and commons or third estate, *tiers état*, sat separately. The third estate invited the others to join in its deliberations, and on their refusal, decided in June to call themselves the National Assembly, claimed sovereign powers, and proceeded to act on this assumption. Having drawn up a new constitution, which Louis accepted, the national assembly was dissolved Sept. 30, 1791.

After the capitulation of Paris, a national assembly was chosen to treat with Germany for peace. It was elected under a law of 1849, and its 753 members met at Bordeaux, Feb. 13, 1871. Like its predecessor, it was a sovereign body, and was responsible for a constitution. Today the national assembly is the name given to the Chamber of Deputies and the Senate, when they sit together for the election of a president, the revision of the constitution, or some other special purpose.

In 1918, after the abdication of the kaiser, it was decided to call a German national assembly to decide the future of the country. The members were elected in Dec. and met at Weimar early in 1919. *See* Constituent Assembly; France: History; French Revolution.

**National Assistance Board.** *See* Public Assistance.

**National Convention.** Name given to the body summoned in Aug., 1792, to revise the constitution of France. Its predecessor, the legislative assembly dominated

by the commune of Paris, had suspended the king. The elections took place at once, 749 members being returned, and the convention declared the monarchy abolished and France a republic. In its fierce party conflicts took place, and its period of life covered the execution of the king and the Reign of Terror. Eventually it drew up the constitution known as the Directory, and on Oct. 26, 1795, it was dissolved. *See* French Revolution; Girondins; Jacobins; Mountain; Robespierre, etc.

**National Debt.** Total of the debts owing at any one time by a state or government. A state, like an individual, must limit its expenditure over a given period to its income for that period, or borrow to make up the difference. The ideal course is so to adjust taxation as to provide sufficient revenue each year for the anticipated expenditure of that year, with a slight margin for eventualities. But it is not always possible or desirable to do that, and borrowing is then resorted to.

Thus, in time of war state expenditure rises so steeply that it is impossible to meet it wholly from current taxation. The British national debt constitutes in its progressive expansion almost a record of the wars in which the U.K. has been engaged. In 1694 it stood at one million pounds; in 1763, after the Seven Years' war, at £146 millions; in 1784, when the American war was concluded, at £243 millions; after the close of the Napoleonic wars at £861 millions; in 1920 at £7,829 millions. It had fallen to £7,653 millions by 1929, but in 1946 it reached £25,000 millions.

Less spectacular additions may also be made by peace-time expenditure of a capital nature. Such additions in the U.K. have in the past been chiefly to finance state housing and other public works; the nationalisation of coal, electricity, transport, etc., after 1946, which involved the purchase by the state of various undertakings from their former private owners, was also financed by loans (or the issue of govt. stock). Elsewhere, national borrowing has been associated with the construction of rlys., roads, harbours, even towns.

Governments may borrow internally or externally. In internal borrowing the lenders are the general public and the institutions which comprise the state. External loans are subscribed by other governments or their nationals.

Thus, in the last century investors in the U.K. provided much of the capital needed by Dominion govts. as well as those of S. America and Russia. Before the Second Great War the interest annually paid on such loans constituted a valuable source of foreign income for Great Britain and helped to pay for her imports. To pay for wartime purchases a large part of this invested capital was sold and British income from abroad was correspondingly reduced.

During both Great Wars, and after the Second, the U.K. borrowed heavily from other members of the Commonwealth and from the U.S.A., but even so the internal part of the national debt far exceeded the external part.

Internal lending in the U.K. is represented by govt. securities, divided into: (i) the funded debt, including e.g. 3½ p.c. war loan, 2½ p.c. consols, 3½ p.c. conversion loan, which has been placed upon a more or less permanent basis; (ii) the unfunded debt, which comprises e.g. 3 p.c. and 2½ p.c. defence bonds and all issues of national savings certificates; (iii) the floating debt, which is for the most part temporary and includes treasury bills and treasury deposit receipts, both repayable within three months, together with advances made to the Treasury by the Bank of England and other government depts. The government repays these floating debt investments by making a fresh issue, sometimes for a sum larger than that being repaid, as an old issue is repaid. The same principle is applied to the longer dated loans constituting (ii). Repayment of these is frequently offered at the option of the government between certain given dates: e.g. the issue of 3 p.c. savings bonds made in 1941-42 was described as 3 p.c. savings bonds 1955-65. At any time after Aug. 15, 1955, the government may, but not later than Aug. 15, 1965, it must, repay the loan. If, say, in 1955 it can, owing to the monetary conditions then prevailing, borrow for a relatively long term at less than 3 p.c., it will probably issue a new loan to repay 3 p.c. savings bonds 1955-65. If prevailing interest rates in 1955 are higher than 3 p.c., it will allow the savings bonds to continue until 1965, and then issue another loan, at the best interest terms it can, to repay them. The first procedure is called conversion, and reduces the interest cost of the national debt; an example was the conversion of

£1,911 millions of the war loan issued during 1914-1918 at 5 p.c. to a 3½ p.c. loan in 1932, the holders at the time being offered the lower interest rate in future or their money back.

Longer term British government securities can always be sold on the London stock exchange, though, of course, the price at which they sell may be less than that at which they were bought. National savings certificates and defence bonds are repayable by the government at, or over, their original cost on demand or within a very short period.

Although the national debt constitutes a burden upon every individual forming the state—the interest payable on that of the U.K. represents more than £11 per annum per head of the whole pop.—to increase it, even seriously, is not in given circumstances altogether harmful. During the Second Great War the British national debt increased by some £17,000 millions, or about half the cost to the govt. of that war. Had taxation been imposed to meet the whole cost, the burden would have been intolerable. On the other hand, most of this state expenditure was paid out as wages, profits, rentals, etc., and continued borrowing from the general public had a beneficial effect upon the nation's economy since it reduced the amount of money in circulation and thus helped to prevent rise of prices. It also placed in reserve a vast sum upon which the public could draw to produce private demand for goods and services. Nevertheless, it is not good to allow the national debt constantly to increase, and during periods of relative prosperity budget surpluses are normally used to repay part of the debt.

**National Defence Contribution.** British tax on excess profits of industry imposed by the Finance Act of 1937 to pay for rearmament. As originally proposed, the tax was calculated on a complicated basis, and called forth such criticism that Neville Chamberlain substituted a straightforward additional tax on profits above £2,000 a year—5 p.c. for companies and 4 p.c. for firms and individuals, professional men being exempt. Imposed for a period of five years, the tax was expected to yield £25,000,000 a year, and this figure was in fact exceeded. The Excess Profits Tax (*q.v.*) of 1940 was an alternative to the N.D.C., the higher figure being payable.

**National Fire Service.** Name given to the fire brigades of the U.K. on their reorganization in 1941, when control was transferred from local authorities to a central administration. It was dissolved by an Act of 1947. *See* Fire Service.

**National Gallery.** Term usually applied to a collection of pictures and statuary belonging to a nation, and maintained and added to by public funds. One of the first of such galleries was founded by Napoleon I when he converted the Louvre into a national museum, depositing in it a collection of works of art from the treasure-houses of Europe.

The National Gallery in London was begun by the purchase by the British government of the Angerstein collection of pictures in 1824. Later purchases, bequests, and gifts have made it one of the most representative collections in Europe. The pictures are arranged according to schools of painting, and the collection is particularly rich in examples of the Flemish and Dutch schools. The Florentine, Venetian, and Umbrian schools are shown almost equally well, among the gems of the collection being masterpieces by Filippo Lippi, Botticelli, and Michelangelo, Titian, Tintoretto, and Veronese, della Francesca, Perugino, and Raphael. Among the Spaniards Murillo, Velazquez, and Goya, and among the Frenchmen Claude and Poussin are magnificently represented. The British school is displayed from its beginnings, the collection of Turners being especially fine.

The existing gallery on the N. side of Trafalgar Square, once derisively styled "the national cruet-stand" from the arrangement of its somewhat ineffective cupolas, was completed and opened in 1838, and re-opened after enlargement in 1861. It is controlled by trustees, and a director appointed by the first lord of the Treasury.

During the Second Great War, many pictures were removed for safety to the university of Wales at Bangor, the National Library of Wales at Aberystwyth, and Mentmore House, Bucks. Owing to the increasing weight of enemy bombs

used and the development of aerodromes near these repositories, a store was built in the Manod slate quarry, Blaenau Ffestiniog.

From Oct. 10, 1939, to April 10, 1946, a series of midday concerts, organised by Dame Myra Hess, was given at the National Gallery. The concerts, which numbered 1,698, were attended by some 800,000 people in all. During the Second Great War the buildings were damaged by enemy bombs, many galleries remaining closed for several years after the war.

In 1946 the report was issued of the Massey committee on the functions of the National Gallery and the Tate Gallery and the working of the Chantrey bequest. This emphasised that the National Gallery was a group of various masterpieces rather than a historical collection. Philip Hendy, who succeeded Sir Kenneth Clark as director, organized an exhibition of cleaned paintings by old

National Gallery, facing Trafalgar Square, London

masters which aroused great interest and some criticism.

In Edinburgh is the National Gallery of Scotland, a building in Ionic style, 1850-58, with paintings of the Italian, Dutch, and French schools and an unrivalled collection of Raeburns.

In the U.S.A. the National Gallery of Art, in Washington, D.C., was established by Act of Congress in 1937 and inaugurated in 1941 as a gift to the nation by Andrew Mellon. The gallery is 785 ft. long and one of the world's largest marble structures. It cost some \$15,000,000 (£3,750,000) provided by Mellon, who also gave his collection, 127 paintings of the various European schools and 26 pieces of sculpture. All the collections amount to more than 1,000 paintings and pieces of sculpture and 14,000 prints. The gallery is a bureau of the Smithsonian Institution. *See* Hermitage; Louvre; National Portrait Gallery; Tate Gallery.

**National Government.** Name of the all-party administration which governed Great Britain 1931-40. It was formed in Aug., 1931, by the Labour prime minister, Ramsay MacDonald, as the result of the economic crisis of that year and the split in the Labour govt. and party over the proposals to meet it. Few of his colleagues chose to support him in the new administration, and the majority of the Labour party went into opposition. Those who remained with him styled themselves National Labour. The new govt. also included Conservatives, National Liberals (following the leadership of Sir J. Simon, in full support), and Liberal Nationals (led by Sir H. Samuel and holding reservations on the question of free trade). A few Liberals followed Lloyd George in support of the opposition. An appeal to the electorate followed in Oct., when the govt. asked for a "doctor's mandate" to surmount the crisis. The Conservatives, returning 472, formed a big majority of the new house, also of those supporting the govt., only 48 of the other three "National" parties being returned. Nevertheless the label National and the sharing of offices were retained and MacDonald remained premier until his resignation in 1935, when Stanley Baldwin, the Conservative leader, succeeded him. The Liberal Nationals had meanwhile gone into opposition. After the 1935 election the govt. was still nominally National though virtually Conservative. Baldwin retired in 1937, and was succeeded by Neville Chamberlain. When Great Britain declared war on Germany in 1939, the Labour opposition declined all offers of a coalition under Chamberlain's premiership. But by May, 1940, as a result of the debate on Allied failures in Norway, it had become clear that a broadening of the basis of the govt. was essential for the purpose of waging the war fully. The Labour party indicated their willingness to enter a new coalition under Winston Churchill. Chamberlain therefore resigned, and the National govt. gave place to the Churchill coalition govt. *See* Baldwin, 1st Earl; Chamberlain, N.; Conservative; Labour Party; Liberal; MacDonald, J. R.; Means Test.

**National Guard.** Volunteer militia of the U.S.A. The guard is organized in state forces with each state governor as commander-in-chief, and it receives

instruction, arms, and equipment from the U.S. army, which also pays wages for armoury drills and 15 days of field training each year. Members are liable to be called to quell disturbances or to serve as federal troops.

An earlier National Guard was the body of citizens organized in Paris by Lafayette at the outbreak of the Revolution, 1789.

**National Health Insurance.** See Insurance, National.

**National Health Service.** See N.V. section at end of Vol. 10.

**National Hunt Committee.** Self-elected body responsible for the conduct of horse racing under National Hunt rules, i.e. cross-country racing, steeplechasing (q.v.), and hurdling. It is similar to the Jockey Club (q.v.).

**Nationalisation.** Transfer of the ownership and control of property from individuals or groups to the nation as a whole. Property to which nationalisation may be applied includes: (1) land and all rights attaching to it, together with machines and other equipment, e.g. rlys.; (2) certain rights only in the land, e.g. mineral rights, development rights; (3) commercial and industrial undertakings, with all their assets and liabilities, contractual rights and duties, transferred as "going concerns," e.g. gas undertakings; (4) monopoly rights assumed by the state, e.g. issue of currency and coinage, manufacture of tobacco, organization of foreign trade.

Nationalisation of property or of an economic activity may be introduced with any of the following objects: (1) to advance the safety of the state or to increase the security of the existing govt.; (2) to strengthen the control by the govt. of economic resources; (3) to secure monopoly gains and unearned increment for the public revenue; (4) to increase technical efficiency by unifying control, eliminating competition, or replacing the motive of profit-making by the motive of public service; (5) to organize large-scale research; (6) to utilise fully resources incompletely developed by private enterprise; (7) to provide commodities and services not already furnished by private suppliers; (8) to prevent the private ownership and control of great aggregations of capital and economic power; (9) to bring about a more even distribution of the national income.

Nationalisation may be effected by (1) confiscation, i.e. the taking of the property from the existing

owners without compensation, a method adopted in e.g. Russia in regard to land, and a common incident of conquest and colonisation; (2) purchase from the current owners, the price being determined by arbitration, the market quotation for shares, govt. decree, or parl. statute, and paid in cash or by the issue of govt. bonds of limited marketability: such a purchase may involve an element of confiscation, if the owner is made poorer through the compulsory transfer of his property; (3) direct govt. investment, state funds being used directly to finance the construction of a new undertaking, such as a rly. or irrigation works.

#### Methods of Operation

Nationalised properties may be administered (1) directly, through a govt. dept.: an outstanding example of this type is the British Post Office, answerable to parliament through the Postmaster-General; (2) through special corporations created by the legislature, and invested with a national monopoly and a varying degree of autonomy, e.g. the British Broadcasting Corporation, the National Coal Board, the Port of London Authority; (3) through regional boards, closely linked with county councils and other local govt. authorities, e.g. the national hospital service.

In many countries some or all of the railways are nationalised, sometimes to encourage economic development and wider settlement, sometimes for defence, sometimes to increase the efficiency of transport. Many countries have nationalised posts, telephones, and telegraphs. A partial nationalisation of hydro-electric generation is common in mountainous countries. In the U.S.S.R. and territories politically allied, nationalised industry is the rule, although some private agriculture and much private internal trade and some types of private manufacture are permitted. Most countries have a state central bank in a similar position to that of the Bank of England since 1946.

#### Arguments for Nationalisation

Those who advocate nationalisation argue: (a) it is undesirable that personal profit should be the chief motive of economic activity, with the increase of public welfare or public usefulness merely a by-product; and, moreover, it is often possible to increase private profit more by withholding goods or services than by providing them; (b) competition is wasteful

of resources, so wasteful that there is an inherent tendency for private undertakings to combine to lessen competition; this combination may result in unjustifiable increases in the price of goods, and concentrates too much economic power in the hands of a few individuals, who control large aggregations of capital and hence wield great political power without being responsible to parliament; (c) over an increasing part of the economic field monopoly is natural, that is, technically much more efficient than competition, and monopoly gains should be secured for the public; (d) in the state of today extensive planning of the use of economic resources is necessary and such planning is much facilitated by unified control; (e) nationalisation makes possible the fullest exploitation of resources, the utmost development of technique through large-scale research, the employment of the best technical and managerial ability, the greatest economy through bulk purchase, etc.

#### Arguments against Nationalisation

Those who oppose nationalisation argue: (a) there is no adequate substitute for private profit as an incentive, and when that incentive is removed managers lack the urge to be efficient: when competition is absent they tend to become complacent, lacking in initiative, and unwilling to experiment or to take risks; (b) nationalised undertakings become too rigid and over-centralised: men on the spot are unable or unwilling to take decisions, and there are in consequence unreasonable delays in making necessary or desirable changes of policy; (c) any tendency on the part of monopolies to exploit the public can be met by control of monopolies without unnecessary interference in their management; (d) nationalisation places numerous important and lucrative positions within the gift of the govt., and thus tends to political corruption; (e) extensive govt. investment in the existing equipment of an industry may make it more difficult than under private enterprise to secure the introduction of new machines embodying fresh discoveries and inventions.

Problems incidental to the running of new state enterprises are: (1) Method of organization and management: what structure of authority will best retain for nationalised undertakings flexibility, adaptability, and responsiveness to changes in demand,

supply, and technique, and ensure that employees at all levels work effectively? (2) How can the interests of consumers be safeguarded when they are no longer able to express their dissatisfaction by giving their orders to other suppliers? (3) What are to be the tests of the efficiency of a nationalised undertaking, particularly if, as may often be the case, the undertaking is not expected to work at a cash profit? Standards of efficiency can probably be fixed by publishing details of working costs in relation to output, and comparing these with those of similar undertakings elsewhere. (4) What is the best method of exercising parliamentary control over the bodies which are entrusted with the conduct of nationalised industries? Trial and error, aided by the developing science of management, which uses as two of its principal tools statistical method and psychological investigation, must provide the solutions of these problems.

**Nationalist.** Name given to any political party that works for the independence of a country that is part of, or under the domination of, a larger unit. There has been a tendency also to apply the label to a party that opposes what it may consider to be disruptive forces within a state. Thus Gen. Franco's party in Spain adopted the title Nationalist.

The Irish Nationalist party appeared in an organized form about 1870 under the leadership of Isaac Butt, and was strong in the British house of commons after the general election of 1874, becoming still more so under the direction of C. S. Parnell. Its main object was to secure home rule for Ireland. With about 80 members it exercised considerable influence in British politics, especially when, as in 1892-95, the two main parties therein were fairly evenly balanced. Split after Parnell's appearance in the divorce court in 1890, the party was reunited under J. E. Redmond, but it disappeared at the election of 1918, its place being taken by Sinn Féin (*q.v.*).

**Nationality.** Generally, the sum of the characteristic differences between groups of persons which arise from divergences of cultural tradition and language. Such a group is called a nation, and should be distinguished from a group living under the same government, which is usually called a state. The boundaries between nationalities, even when geographically separate, do not always correspond with the

frontiers of states. Sometimes one state includes groups of several national origins.

There is no clear demarcation between the characteristics of a small local group and the more important and permanent characteristics of a nationality, as there is no clear difference between a dialect and a language; but in general a nationality involves a traditional outlook on life, traditional quasi-religious ideals, and a fully developed mode of expression in a language with a literature. Nearly always nationality is connected with some country or district, even when, as in the case of the Jews, the connexion is one of memory.

From the sense of nationality arises the political enthusiasm called nationalism. This originates either from oppression or from an exaggerated sense of the importance of the group. Thus the nationality of the Italians in 1860 was felt to be oppressed by the Austrian government in Italy; but after the victory had been won against Austria, the formerly oppressed group developed an exaggerated sense of its own importance.

Nationality may be, or may be made to serve as, the basis of a distinct form of government; but it may in certain cases be well developed within the same state together with other nationalities. Of the formative elements in nationality the most important is tradition; by which is meant an inherited admiration for certain types of character and certain kinds of life. In almost all nationalities there are quasi-mythical national heroes who are believed to have been the embodiment of the national ideal; and in every nationality its history is believed to be a record of success and progress of its own excellence. These beliefs, although insufficiently based on evidence, are not necessarily pernicious; but the discovery of the actual scientific facts as to descent, language, and moral or religious tradition has tended to weaken the control of the idea of nationality over the minds of men. See *Ethnology*, *Language*.

**National Liberal.** Political party label adopted at various times in various countries. The most notable and influential example is the National Liberal party in Germany between 1866 and 1918. It was "national" because it originally advocated union between N. and S. Germany, as achieved in 1871. From that year until 1878 the party helped Bismarck to carry out many reforms

and supported him in his opposition to the R.C. church. But it broke with him over his experiments in state socialism and protection, and its influence declined.

In the U.K., on the break-up of the Lloyd George coalition govt. in 1922, the former Liberals of the coalition, under Lloyd George, called themselves National Liberals, as a distinction from the independent Liberals under Asquith; but the two branches were reunited in time for the 1923 election as "Liberals without prefix or suffix." In 1931 those Liberals who followed Sir J. Simon in full participating support of Ramsay MacDonald's National government called themselves National Liberals (or, popularly, Simonites), whereas those who followed Sir H. Samuel in holding reservations on the question of free trade or protection adopted the name of Liberal Nationals (Samuelites), until, seceding from the government, they became once again Liberals. The term was still in use during the elections of 1945 and 1950 for Liberals prepared to support the Conservative leader.

**National Liberal Club.** London political club. It was formed, Nov. 16, 1882, with Gladstone as president, to further the interests of Liberalism, and to provide a central club in London for Liberals throughout the kingdom. Among its objects was "to found, in connexion with the club, a political and historical library, to be called the Gladstone Library, as a permanent memorial of the services which the Right Hon. W. E. Gladstone has rendered to his country." The inaugural banquet was held on May 2, 1883.

The club-house, in Whitehall Place, overlooking the Thames Embankment, was opened in 1887. The Gladstone Library was opened in 1888. The membership is about 3,650.

**National Library of Scotland.** Founded in 1682, this library belonged to the Faculty of Advocates until 1925. It has the privilege of receiving a copy of every book entered at Stationers' Hall. It is housed in the Parliament House, Edinburgh, and contains over 500,000 volumes, as well as many valuable MSS. dealing with Scottish history. It is open to all engaged on literary work.

**National Park.** Area of relatively wild country publicly owned and nationally administered so that its characteristic beauty is preserved and facilities for its public enjoyment are provided.

National Physical Laboratory. Air view of the extensive buildings of the research laboratory at Teddington, Middlesex  
*Crown copyright*

Wild life and existing buildings of interest are protected, and new building is controlled.

In July, 1945, a National Parks Committee appointed by the minister of Town and Country Planning recommended the establishment of 12 national parks in England and Wales: the Lake District, Peak District, Dartmoor, Yorkshire Dales, Exmoor, South Downs, Roman Wall, north Yorkshire moors, Brecon Beacons and Black Mountains, Norfolk Broads, and certain stretches of N. Wales and the Pembrokeshire coast. The National Parks and Access to the Countryside Act, 1949, set up a commission to schedule and preserve national parks and areas of outstanding natural beauty, and gave powers to establish nature reserves.

S. Africa possesses some notable national parks, e.g. the Natal National Park, embracing 20,000 acres of the northern part of the Drakensberg mts. Kruger National Park, between the Sabi and Limpopo rivers, was established as a game sanctuary in 1898 and has an area of 8,000 sq. m. In Cape Province there are the Kalahari Gemsbok, Addo Elephant, and Mountain Zebra national parks, many being also game preserves. The principal national park in Australia is at Port Hacking, N.S.W., 15 m. S.W. of Sydney, and covers an area of 58 sq. m. with a frontage on the Pacific of 7 m. The Albert National Park in the N.E. Congo is maintained by the Belgian govt. as a game and nature preserve.

The U.S.A. has some fine national parks. They are administered by the department of the Interior. The best known are the

Glacier (997,487 acres), a rugged mountain region with 200 glacier-fed lakes; the Grand Canyon (645,136 acres), the largest example of erosion in the world; the Mammoth Cave of Kentucky (50,548 acres); Mount McKinley, Alaska, (1,939,000 acres), which includes the highest mountain in N. America; Mount Rainier (241,526 acres), the greatest single-peak glacial system in the U.S.A.; Yellowstone Park (2,213,207 acres), which has more geysers than the rest of the world; and Yosemite (756,295 acres), which has unique lofty cliffs and three groves of giant sequoias.

There are some 30 national parks in Canada with a combined area of 29,704 sq. m., the largest being Jasper (*q.v.*), 4,200 sq. m.

**National Physical Laboratory.** A research laboratory founded in 1900 at Teddington, Middlesex, in Bushey House, an old royal residence granted for the purpose. The laboratory, covering 50 acres, consists of 16 large and a number of smaller buildings. It was controlled by the Royal Society until 1918, when it was absorbed by the newly constituted department of scientific and industrial research, though the president of the Royal Society is *ex officio* chairman of the general board, while the executive committee includes amongst its members representatives of the Royal Society.

The main functions of the laboratory are to carry out research; to establish and maintain precise standards of measurement and physical constants; and to make tests of instruments and materials. It also undertakes investigation of special problems. Payment is received for work done for outside bodies, and the laboratory receives a govt. grant. Research undertaken includes all branches of physics.

There are a number of departments, each under a superintendent, and each specialising in one branch of physics. Increasingly important is the aerodynamics department, which operates under the control of an aeronautical research committee appointed by the Air ministry. The Wilham Froude Laboratory carries out tests of ship hulls and propellers.

Results of researches are published in an annual report, and a collection of abstracts of all the papers contributed by the laboratory to the scientific and technical press is issued each year. Its directors have included Sir Richard Glazebrook, Sir J. E. Petavel, and Sir Charles G. Darwin.

**National Portrait Gallery.** Building in St. Martin's Place, London, W.C.2. It contains about 3,500 paintings, sculptures, and drawings of men and women who have figured with distinction in the history of the United Kingdom. No portrait of any living person, except of the reigning sovereign and of his or her consort, is admitted, and no modern copy of an original portrait. The gallery was founded by Act of parliament, June 6, 1856. Opened at 29, Great George Street, Westminster, 1859, the collection was housed at S. Kensington, 1869-85; at Bethnal Green Museum, 1885-95.

The existing structure, built 1890-95 in Italian style from designs by Ewan Christian, was

National Portrait Gallery, St. Martin's Place, London

opened April 4, 1896, at a cost of £96,000, of which William Henry Alexander, of Shipton, Andover, Hants, contributed £80,000 and the government £16,000 and the site. An extension, the cost of which was defrayed by Lord Duveen, was opened in 1933. The Scottish National Portrait Gallery, Queen Street, Edinburgh, built in 14th century Gothic style from designs by Dr. Rowand Anderson, was opened in 1889. The building cost over £80,000, and was the gift to the nation of John R. Findlay (1824-98), proprietor of The Scotsman.

**National Provincial Bank, Ltd.** English banking company. Established 1833 as the National Provincial Bank of England, the first bank formed in London with the express object of developing a number of provincial offices controlled from London, it was registered as a limited company in 1880. In 1918 it amalgamated with the Union Bank of London and with other banks, then becoming known as the National Provincial and Union Bank of England. The present shorter form was adopted in 1924. By that time the bank had become affiliated with Coutts & Co. and also with Grindlay & Co., the Indian bankers (now Grindlays Bank, Ltd.), who, however, retained their separate identities. The bank has a substantial interest in Lloyds and National Provincial Foreign Bank,

Ltd., and the Bank of British West Africa, Ltd. There are 1,223 branches and offices: head office, 15, Bishopsgate, London, E.C.2. Paid-up capital, £9,479,416.

**National Register.** Census of Great Britain taken during the two Great Wars to ensure that the best use should be made of man-power, and to make rationing possible. The register compiled Aug. 15, 1915, covered all inhabitants of Great Britain between the ages of 15 and 65, and was used by the government when compulsory service was introduced. On Sept. 10, 1939, the minister of Labour introduced a National Registration Bill providing for a complete register of the whole country. Schedules were distributed during the week before Sept. 29, which was fixed as National Registration Day, and on their collection identity cards were issued, similar to the registration cards of the First Great War.

The procedure for taking the register was similar in both wars. The country was divided into a number of areas—65,000 in 1939—each of which embraced 200-300 households. Details required were name, sex, date of birth, whether or not married, occupation, membership of reserve or auxiliary forces or civil defence. Registered persons were allotted a number. The register was retained after the end of the war. *See Identity Card.*

a committee appointed by the chancellor of the Exchequer to consider how to check personal expenditure and enforce economy throughout all ranks of society, made two recommendations: that a new type of security—the savings certificate—should be issued; and that a national savings committee should be set up to organize an appeal to the whole country. The first savings certificates cost 15s. 6d. and were worth £1 on their fifth anniversary. They could be cashed at cost, plus accrued interest, at any time. The interest was free of income tax, and a limit of 500 was therefore set to the number any one person might hold. The terms on which certificates were issued have been modified from time to time, but the basic principle remains.

The introduction of this novel and ingenious financial instrument, which concentrated attention on the growth of capital instead of on the periodical distribution of interest, was an important factor in the success of the savings movement.

#### Between the Wars

Before the end of the First Great War the national savings committee had established local savings committees throughout the country, and brought into being over 40,000 savings groups. The movement was non-political; local authorities and schools helped. The committee also conducted campaigns for "large money" savings, and raised in all £4,040 million.

In 1919 the appeal to save to help win and pay for the war gave way to appeals to save for wise spending. The Post Office savings bank and trustee savings banks were brought into closer association with the national savings committee. The interest of local authorities was maintained and stimulated by empowering them to borrow through the public works loan board up to one half of the value of certificates sold in their area. This arrangement was later modified by the Local Authorities Loan Act, 1945, whereby all local authorities borrow from the consolidated fund, into which the proceeds of national savings flow.

Elected representatives of local savings committees were added to the national savings committee, which had previously consisted solely of nominated members representing various interests. At the same time a body meeting once a year and numbering some 250 members, also elected by local

## NATIONAL SAVINGS MOVEMENT

Lord Kindersley, President, National Savings Committee, 1930-46

*The story of the growth of a great British thrift movement, and an explanation of its objects, by the man whose guidance helped to ensure its success*

The national savings movement began in 1916. Organized saving by persons of small means had its foundation laid by the trustee savings banks as early as 1810, followed by the Post Office savings bank in 1861. During the 19th century friendly societies and other corporate bodies also played their part in the encouragement of thrift; but until 1916 there was no nationally organized effort to promote saving.

In England and Wales the movement had at its peak an organization comprising several hundred thousand voluntary workers, members of some 1,340 local savings committees, and secretaries and collectors of some 300,000 individual savings groups formed in factories, offices, schools, streets, and villages, social organizations, and units of H.M. forces. Volun-

tary workers in the movement are assisted by a relatively small official staff, and stimulated, encouraged, guided by the national savings committee with h.q. in London and regional offices in the provinces, each with its commissioner and staff. The national savings committee, appointed by the chancellor of the Exchequer, initiates the general plans for the savings campaign and is responsible for advertising and promoting the sale of various forms of national savings securities and investment in savings banks. In Scotland and Northern Ireland the work is supervised by autonomous committees which follow broadly the plans devised by the national savings committee.

During the First Great War dangerous inflation had been reached by 1915. Early in 1916

savings committees and called the national savings assembly, was established so that the work of the movement could be debated.

In Sept., 1939, there were 41,521 active savings groups, 23,755 of them in schools. During the Second Great War the national savings movement again helped to mobilise the nation's financial resources. The organization throughout the country was strengthened. The trade union movement and the employers' federations gave full support, 77,000 groups being established in places of employment. The number of school groups increased to 30,626, and more than 120,000 new groups were formed in streets and villages. The provincial organization was strengthened by the setting up of regional advisory committees composed of the assembly members in each of the regions. Special advisory committees dealt with the problems of particular sections of the public. The women's voluntary services (W.V.S.), the women's institutes, and other social bodies through their local branches provided many thousands of new recruits for the movement's committees and groups. Banks, insurance companies, and all the manifold commercial, business, and financial organizations gave their assistance; and the campaign was supported by widespread advertising and publicity in the press, the cinema, and by the B.B.C. Special weeks were organized in which local committees fixed sums of money as specific objectives. War Weapons weeks 1940-41, Warship weeks 1941-42, Wings for Victory weeks 1942-43, and Salute the Soldier weeks 1943-44, raised £2,259,000,000, of which £633,000,000 was in small savings.

After a series of Thanksgiving weeks in 1945, when £512,000,000 was raised, the movement again restricted its money-raising efforts to the small saver. A rally at the Albert Hall in 1946 celebrated the movement's 30th anniversary.

In 1950 there were 17 million live holdings in savings certificates; 21½ million accounts in the Post Office savings bank; 4½ million accounts in the trustee savings banks; and nearly 4 million holders of defence bonds. The amount standing to the credit of these holders, including stock on the savings bank register, amounted to over £6,100 million, including interest accrued. The total put into savings between

Nov. 1939 and Sept., 1945, reached £9,851 million, of which £3,870 million was in so-called "small" savings.

**National Service.** Service on behalf of the country in time of emergency, either in the armed forces or in essential work. In the First Great War a ministry of National Service was created, Aug., 1917; in Nov., 1917, it took over from the army the direction of recruiting. It was merged in the ministry of Reconstruction in Nov., 1918. During the Second Great War national service was the responsibility of the minister of Labour, whose department was renamed the ministry of Labour and National Service in Dec., 1939. The minister had the task of allotting man-power between the armed forces and the vital war industries, and after the war retained responsibility for the call-up for compulsory service in the forces. Under the National Service Acts, 1947, male British subjects ordinarily resident in the U.K. who were 18 or over and under 26 were, after Jan. 1, 1949, liable to serve in the armed forces for 18 months' whole-time service and afterwards for 4 years' part-time service in an appropriate auxiliary unit. A person may ask to be called up at 17½. During the part-time service he may be called on for 60 days' service in all, but not more than 21 days in one year. Provision is made for further education during whole-time service, for reinstatement in civil employment, and for conscientious objectors. See Compulsory Military Service; Man Power; Military Service Acts.

**National Socialism.** Details of this German political philosophy will be found under Nazism.

**National Sporting Club, THE.** Headquarters of British boxing. Originally founded on the site of Evans's old house in King Street, Covent Garden, London, in 1891, it issues its own code of rules. The 5th earl of Lonsdale was president from its inauguration to his death (1944). See Boxing.

**National Stud.** Stud farm for thoroughbred horses, the property of the British Government and administered by the ministry of Agriculture. It was originally established in 1915 at Tully, co. Kildare, as a result of a gift of Lord Wavertree (formerly Col. Hall Walker), and transferred in 1942-43 to Gillingham, Dorset. In practice the stud is conducted on similar lines to those of private or commercial studs. Yearlings

are offered for sale by auction, except a few which are leased to private owners for racing. The stud also maintains stallions, which serve a limited number of mares.

**National Theatre.** The project to institute and build a national theatre in Great Britain was launched in 1908. Almost the last European country to realize and acknowledge the value of drama as a national institution (France recognized the need by founding the Comédie Française in 1680), Great Britain at first depended for the formation of this scheme on the generosity of wealthy benefactors. It was launched under the title of the Shakespeare Memorial National Theatre, and a subscription list was opened, headed by Sir Carl Meyer, with £70,000. The theatre was to have been built and opened in celebration of the Shakespearian tercentenary in 1916, but the First Great War intervened.

By 1936 the original fund had increased to £150,000; a site in London was bought for £75,000. This comprised 17,000 ft. on an island site in Cromwell Road, S. Kensington, facing the Victoria and Albert Museum. Plans by Sir Edwin Lutyens and Cecil Masey provided seating accommodation for over 1,000, with a stage suitable for both intimate and spectacular plays. Two or three plays were to be presented every week, and nine added annually to the repertory, three Shakespearian, three classic, and three contemporary, and a permanent company of 25-30 players engaged on yearly contracts, the management to be controlled by a director, subject to the governing body, itself nationally appointed.

The Second Great War held up further development of plans. By 1945 the S. Kensington site was considered too small, and the L.C.C. leased to the trustees a site on the S. bank of the Thames (midway between Hungerford and Waterloo bridges) in exchange for the one in Cromwell Road. It was here proposed to erect two theatres, one to accommodate 1,200, and the other to seat 500. Prospects of building were advanced in 1946 by an agreement between the Shakespearian Memorial National Theatre committee and the Old Vic. The S. bank site, however, was first used for temporary buildings of the 1951 Festival of Britain.

In March, 1948, it was announced that the government proposed to supplement the Committee's

funds up to £1,000,000 to meet the cost of building the theatre, and the National Theatre Act, 1949, gave effect to this.

**National Trust.** A British society for preserving places of historic interest or natural beauty. Founded in 1895, and given statutory powers in 1907, it is governed by a council, half nominated by learned societies, and half by members of the Trust. The National Trust Act, 1937, extended the powers of the Trust to hold properties as investments, and extended the aims of the trust to include the preservation of buildings, etc., of national, architectural, historic, or artistic interest, the protection and augmentation of their amenities, and the acquisition of furniture, pictures, etc., having a similar interest.

National Trust property is acquired either by purchase or by gift. When property is given no death duties are payable. Estates are in general leased to individuals, who are bound to allow access to the public at intervals. Beauty spots owned by the trust include Stonehenge; Leith Hill, in Surrey; Bolt Head, Devon; Longshaw Moor, near Sheffield; and tracts in the Lake District and the New Forest. Among private estates presented to or acquired by the National Trust are Barrington Court, near Ilminster; Bateman's, Rudyard Kipling's house at Burwash, Sussex; Lord Astor's estate of Cliveden, at Cookham-on-Thames; and Sir Charles Trevelyan's estate at Wallington, Northumberland, at the time of its presentation the largest ever made over to the trust. Other buildings of interest include the George Inn, Southwark, and Flatford Mill, Suffolk, made famous by Constable's painting.

The trust's full name is the National Trust for Places of Historic Interest or Natural Beauty; the offices are at 7, Buckingham Palace Gardens, London, S.W.1. The Scottish National Trust is an independent body, and owns among other property the Pass of Glencoe. See Ancient Monuments; consult On Trust for the Nation, C. Williams-Ellis, 1946, etc.

**National Unions.** Voluntary associations for certain purposes of persons, corporations, and groups within a country: for example, the National Union of Manufacturers, the National Union of Mineworkers. National unions may be associations of employers or of employees, and may be registered trade unions. Most of

them first began as organizations concerned only with one branch of trade or industry or one craft; and frequently they had at first only a localized interest. But most associations of employers and employed have found it advisable to amalgamate or federate with others having allied interests. The whole tendency of recent years has been towards ever larger associations, culminating in this country in the Federation of British Industries, the British Confederation of Employers, the Association of Chambers of Commerce, the Trades Union Congress General Council, and the Scottish Trades Union Congress General Council. From 1932 to 1946 the membership of trade unions increased from 4.4 millions to 8.7 millions, yet the number of trade unions decreased from 1,081 to 753, and of these 17 unions have practically two-thirds of all the members. The Official Directory of Employers' Associations, Trade Unions, Joint Organizations, etc. (1947), includes 1,943 Employers' Associations, most of which are affiliated to national unions, federations, and confederations, and 814 trade unions and other employees' associations, most of which are affiliated to the Trades Union Congress, either directly or through national federations. Consult The Industrial Relations Handbook, particularly Section III and Section XIII.

**National University of Ireland.** Irish university, founded in 1908. It arose owing to the demand of the Irish Roman Catholics for university education, and is in a sense the successor of the Royal University of Ireland, dissolved in that year, two of whose colleges—viz. University College, Cork, and University College, Galway—are included in it; while a third university college was opened in Dublin. S. Patrick's College, Maynooth, is a recognized college. It is controlled by the Roman Catholics, although there are, strictly speaking, no religious tests. Degrees are granted in arts, philosophy and sociology, Celtic studies, science, law, medicine, engineering and architecture, commerce, and agricultural and dairy science. Irish is obligatory for matriculation. The constituent college at Dublin occupies premises on Earlsfort Terrace. See Cork; Dublin; Galway; Ireland; Education.

**National Wealth.** The source of the incomes of the people of a nation, i.e. the source of the supply of goods and services avail-

able to them. The national wealth includes all those things that may have an exchange value, e.g. land and its various capacities for profitable use in industry and trade; natural resources, such as forests, minerals, water supply, etc.; the stock of buildings and their contents, such as machines, vehicles, furniture, industrial materials, food, etc.; the social framework to facilitate production, exchange, and distribution; and the various skills of the inhabitants; together with investments abroad and other rights which entitle the nation or individuals within the nation to receive goods from abroad, and the nation's stock of gold and other forms of money having an intrinsic value. No complete valuation of Great Britain's national wealth exists. The Economic Survey for 1950 estimated the value of the national income during 1950 (i.e. the flow of goods and services derived from the national wealth) at about £10,000,000,000.

**Native** (Lat. *nativus*, natural). Mineralogical term. It is used to describe minerals which consist of a single element, generally a metal, which is in the free state, i.e. not combined with any other element. Gold, silver, platinum, mercury, copper, and arsenic commonly occur thus. Sulphur and diamond (carbon) are instances of native non-metals.

**Native Currants** (*Leptomeria billardieri*). Shrub of the family Santalaceae, native of Australia.

Native Currants. Branches with flowers. Inset, above, end of branch with leaves; below, fruit

The numerous slender branches are erect, and without leaves except near their extremities, where they are very small. The minute white flowers are borne in spikes and produce small greenish-red, currant-like berries, which are fleshy and edible. They are acid and somewhat astringent, but they make a good preserve and a

cooling, acid beverage. They are not related to the British garden currants, or to the dried currants of E. Europe.

**Nativity.** Name of several festivals in the Christian churches. That of Christ's Nativity (Lat. *Festum Nativitatis*; Fr. *Noël*), usually known as Christmas Day, has been celebrated since the 5th century on Dec. 25. The Nativity of the B. V. M., a Roman Catholic festival, mentioned in the 9th century, is kept by Greeks and Latins on Sept. 8; and that of S. John Baptist on June 24. Representations of Christ's Nativity occur often in carvings on early sarcophagi, ivory carvings of the 8th and 9th centuries, in MS. illuminations, stained glass, and wall-paintings. On the Morning of Christ's Nativity is the title of an ode by Milton, 1629. Nativity plays, or dramatic representations of the circumstances surrounding the birth of Christ, with shepherds, wise men, and angels among the characters, are derived from the medieval mystery plays performed originally in churches. They were revived in a more sophisticated form in many English churches and chapels in the 20th century, notably at St. Hilary, Cornwall, and S. Martin-in-the-Fields, London, as a part of the Christmas celebrations. In astrology the word nativity is used as a synonym for horoscope. See *Mystery Play*.

**Natrolite.** In mineralogy, a hydrous calcium sodium aluminium silicate of the zeolite group. Semi-transparent to transparent, it is yellow, red, grey, or colourless with a glassy lustre, and is found in cavities in basalt and related rocks. Natrolite is used as a gem and for ornament, as it will take a high polish. See *Zeolite*.

**Natron.** Term used to describe hydrated sodium carbonate,  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ . Native soda, sometimes called natron, found in the region of desert lakes, consists of sodium sesquicarbonate or trona ( $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$ ).

**Natron.** Lake of Africa. It is about 20 m. S. of Lake Magadi. Both these lakes contain enormous deposits of soda. See *Magadi*.

**Natterjack** (*Bufo calamita*). Running-toad or golden-back. It is a toad with a general resemblance to the common species, yet with several points of distinction that make identification easy at sight. It is of rather slighter build, and the limbs are proportionately shorter, while the warty skin is smoother, and down the centre of the back runs a thin

yellow line. It progresses by walking or running, instead of hopping, and is found mostly in sandy situations, drier than those affected by the common toad. The male has an internal vocal sac which distends the throat when the natterjack utters his rattling note, suggestive of the call of the nightjar. It occurs in N. and W. Europe, including Great Britain. See *Toad*.

**Nattier, JEAN MARC** (1685–1766). French painter. He was born in Paris, and secured the patronage

J. M. Nattier,  
French painter  
After Voisiot

of Louis XIV, being at first employed on drawings for the engravings of Rubens' pictures. The last forty years of his life were devoted to the painting of portraits, often of Court ladies.

**Natural.** Musical sign ♮ used to neutralise the effect of a sharp or flat. It probably derives its name from the key of C, which is known as the natural key, and had no sharps or flats. Its shape comes from the letter h (h) the old German name for B ♯ (B ♯ being called B). See *Flat*; *Sharp*.

**Natural Gas.** Gas which occurs naturally in the earth's crust. Inorganic gases such as sulphur dioxide, chlorine, carbon dioxide, nitrogen, hydrogen, etc., are generally associated with volcanic activity. Organic gases include marsh gas, firedamp, and the gases associated with petroleum. The natural gas from petroleum reservoirs is the basis of a large industry: approximately 4 billion cubic feet were marketed in the U.S.A. during 1945. It is usually composed of paraffin hydrocarbons from methane to octane and even heavier. Many of these condense out and are removed from the gas. Inorganic gases are also sometimes associated with petroleum. Hydrogen sulphide is quite common; occasionally there is a high percentage of nitrogen with some helium; sometimes, as in Mexico, the gas is used commercially as a source of carbon dioxide.

**Natural History.** Term which in its original meaning was used for the study of all natural objects. As such, the study of natural history included that of zoology, botany, geology, and allied sciences. The term has gradually become less broad in its meaning, until now it is confined to zoology and botany.

Natural history is used for the more popular side of the subjects, as distinct from their scientific study. See *Botany*; *Zoology*.

**Natural History Museum.** Collection of objects of natural history. The museum of this name in Cromwell Road, S. Kensington, London, S.W.7, is part of the British Museum. It was opened in 1881 to accommodate the natural history collection in the British Museum, and so relieve the congestion there, and during 1881–85 the exhibits were removed to their new home. There are departments of zoology, entomology, botany, and mineralogy. During the Second Great War it was considerably damaged by bombs, two galleries being burnt out. See *British Museum illus.*

**Naturalisation.** Term used in law to denote the process whereby an alien becomes a subject. In almost every civilized country there are now naturalisation laws. In the United Kingdom it was, until 1870, necessary for an alien who desired to become a naturalised British subject to procure the passing of an Act of parliament in his favour.

Naturalisation in the United Kingdom is governed by the British Nationality and Status of Aliens Act, 1914, as amended by later Acts. By these statutes the home secretary may grant a certificate of naturalisation to any alien who applies for one, if the applicant satisfies the home secretary (a) that he has resided in British dominions for five years at least, of which the last year before the application must be in the United Kingdom, and four years within the preceding eight years in any part of the British dominions; or has been in the service of the crown for at least five years within the preceding eight years; (b) that he is of good character and has an adequate knowledge of the English language; (c) that he intends to reside in the British dominions or to continue in the service of the crown. The certificate has no effect until the applicant has taken the oath of allegiance. In special cases, the home secretary may grant a certificate, although the four years' residence or five years' service has not been within the preceding eight years.

A naturalised alien is in the same position as a natural born subject. Alien infant children become naturalised by their father's naturalisation, if included in the father's application; but on attaining 21 may make a declaration renouncing British nationality.

When an alien is naturalised his wife does not become a British subject unless she makes a declaration within 12 months.

If the home secretary is satisfied that a naturalisation certificate has been obtained by false representation, or fraud, or material concealment, or that the naturalised person has shown himself disloyal by act or speech, he may cancel the certificate. He has also power to cancel on certain other grounds. The Governor of any British possession may issue local naturalisation certificates and if he obtains the approval of the Home Secretary U.K. naturalisation certificates as well.

The British Nationality Act, 1948, based on agreement between representatives of the British Commonwealth, clarified the national status of U.K. citizens within the Commonwealth. It laid down that, as agreed by all Commonwealth countries except Eire, persons recognized as British in any part of the Commonwealth should be so recognized throughout it; there should be a single citizenship, based on existing U.K. law, for the U.K. and the colonies; a woman citizen of the U.K. marrying an alien should no longer automatically lose her British nationality, nor an alien woman marrying a U.K. citizen automatically acquire her husband's nationality.

In the U.S.A. an alien can only be naturalised two years after declaration on oath before a court of his intention of being naturalised, and after five years' residence in the country. He must specifically renounce allegiance to every foreign power, including that to which he formerly belonged, and must also renounce any title of nobility. *See Alien*; *British Subject*.

**Naturalism.** In philosophy, the theory that denies the existence or intervention of any being or principle outside, and higher than, nature, and interprets the whole of experience in terms of natural science. It thus resembles materialism, which is chiefly concerned with the essential nature of things, while naturalism deals with the course and causes of events.

In literature and the arts, naturalism is, strictly speaking, synonymous with realism, *i.e.* a close imitation of reality, but came latterly to imply insistence on the more sordid and repellent aspects of life and nature, owing to the tendency of many naturalistic artists and writers, such as Zola, to emphasise in this manner their antipathy to idealisation.

In painting, the name was originally given to the work of a group of Neapolitans, who claimed to found their art on direct observation of nature, and who had dispensed with Academy teaching. Their influence was transmitted through Ribera to Spain, where it found a nobler expression in the naturalism of Velazquez.

**Natural Philosophy.** Term originally meaning the study of the material world as a whole, now usually called natural science. In a restricted sense the term, which in general use tends to become obsolete owing to the sharper distinction now drawn between philosophy and science, is retained in the sense of physics (*q.v.*) at Oxford, Cambridge, Dublin, and the Scottish universities.

**Natural Region.** Term used in geography to indicate a unit area of a definite type. The Mediterranean region is a unit area with a definite character and, consequently with a definite type of vegetation; and the application to it of the term "natural region" implies first, that it may be inferred that similar physical and climatic conditions would necessarily produce a similar natural flora, and secondly, that the control of human development exercised by an area with its specific limitations will be exerted similarly wherever regions of this type occur. *See Geography*.

**Natural Selection.** Theory of evolution first propounded by Charles Darwin, which forms the basis of his book *The Origin of Species*, 1859. Plants and animals are so produced that there is not room for them all on the earth, and in the struggle for existence only a few survive. According to Darwin, the survivors are those that are best fitted for the struggle through some special variation in structure. This is developed and inherited through many generations, and emphasized and increased until there is established a new species with an advantage over others. Natural selection teaches that the differences are usually small and fortuitous; thus a species has a difference which makes it better suited to its life than its fellows. If this is inherited, its descendants will be more likely to survive.

Darwin was first led to propound his theory by studying bird life during the voyage of the *Beagle*. He noticed that the birds of certain islands showed marked differences in structure from those of the same species on the mainland. This suggested that the birds were in the process of evolving

into different species. Similarly, he noticed that, among the birds on the mainland, different species of the same family in adjacent districts gradually merged into each other, as though they had been permanently altered by their environment.

The theory of natural selection, which was simultaneously propounded by Alfred Russel Wallace, aroused the enmity of churchmen, who regarded the doctrine as a dangerous attack upon the Biblical account of creation, especially when Darwin later extended it to explain the origin of man. Although natural selection is often called the "survival of the fittest," it is worth noting that this phrase was not used by Darwin, but coined later by Herbert Spencer. *See Evolution*.

**Natural Theology.** Branch of theology concerned with proofs of the existence and nature of God, apart from revelation. It is claimed that if God had not revealed Himself to man through the Bible or in any other way, we should still have sufficient reason, if not proof, for believing in His existence.

The ontological argument is based on Plato's theory of universal and necessary ideas, developed by S. Anselm and advocated in a rather different sense by Descartes. All men, it is argued, possess or can possess the notion of a perfect being. But perfection implies existence, for a non-existent being lacks something, *viz.* existence, and is therefore not perfect. Therefore a perfect Being must exist. The validity of this argument was criticised by Kant, who argued that we can conceive perfection either as existent or non-existent.

The cosmological argument views the universe as an effect, and maintains that its existence necessarily implies a cause, *i.e.* God. Or, expressing it differently, the universe exists contingently and dependently; and this implies the existence of the absolute and independent. This argument assumes the contingency of the universe, but fails to prove it.

The teleological argument may be stated thus: The more we study the world of phenomena, the more we see how everything tends to some end and serves some purpose. Hence we have evidence on all hands that phenomena are the result of design on the part of an intelligent designer, *i.e.* God. The *Bridgewater Treatises* and other more or less scientific works were written in support of this thesis, but the discovery of the laws of

evolution has thrown a very different light on the subject.

Another argument points out that mankind gives a general consent to the idea of a God, and urges that what is universally believed cannot be without foundation. But a general notion may conceivably be erroneous. Another argument is based upon design in history, and urges that the whole course of events points to a controlling influence from without.

It has also been urged—notably by Kant—that the moral nature of man points to a categorical imperative external to himself, whose authority he is unable to ignore. Man feels that he ought to do this and ought not to do that—irrespective of his personal wishes or immediate advantage. *See* Deism; God; Theism; Theology. *Consult* Natural Theology, W. Paley, 1802; Natural Religion, F. Max Müller, 1889; Theism and Humanism (G. How Lectures), A. J. Balfour, 1915.

**Nature.** British scientific periodical. It was founded Nov. 4, 1869, by Sir Norman Lockyer, and is published weekly by Macmillan & Co., Ltd. It presents a regular record of scientific progress, prints regularly letters to the editor which incorporate brief accounts of current research by the investigators concerned, and reviews scientific books, scientific papers, etc.

**Nature Study.** The study of natural history, especially by children in primary schools, where it is introduced to stimulate interest in living things and develop powers of observation. It was in the early 20th century the basis of virtually all biological teaching in elementary schools; at first restricted to observation of plant life and drawing of plant forms, it was broadened to include animal life, growing plants in classrooms, gardening, keeping fowls or rabbits, etc. Direct observation of nature is often supplemented by classroom experiments and demonstrations, and may be correlated with art and craft teaching, the keeping of records, rambles, and school camps. Properly taught, nature study may help considerably to develop the child's sense of wonder and beauty. Nature study under various names has a place in the activities of boy scouts and girl guides. In secondary schools it may be extended to biology.

**Nature-Worship.** Ritual expression of reverence for those phenomena of the visible universe which are regarded as capable

of bringing to man good or ill. Students of primeval man assume a stage in his history when he thought of individual objects in nature, especially those displaying movement or action, as animated by powers akin to his own. The action of some of them could always be relied upon, and aroused no anxiety. That of others could not be predicted, and hence there emerged a more or less conscious perception of the supernatural, and the need for establishing relations therewith. Some phenomena became the object of approach or avoidance by processes usually classed as magical; experience showed others to be stronger than man, and to call for propitiation.

The conception of natural objects as animated beings akin to man passed into that of personalised objects or powers, amenable to control or appeal. Out of this arose the idea of supernatural beings dominating the phenomena which were held to be their abode. So, too, there emerged from the animistic conception of human ghosts and of natural objects animated by spirits—human or non-human—the notion of a spirit-haunted world on the one hand, and of separate souls on the other.

Primitive thought deals with individual things; man comes into relationship, intellectual or emotional, with this particular rock, or that particular stream. The formulation of general ideas demands a mental effort which some unprogressive peoples apparently never attained. It was only after prolonged reflection that man reached the abstract notion of the elements, and became capable of thinking of earth, water, fire, or sky as a whole. Nature-worship was at first, if not always, the ritual approach to a multitude of nature-spirits or nature-gods.

In a remote past worship was offered to animals and plants, because on their goodwill seemed to depend the food-supply. Indeed domestication is best explained as an unexpected outcome of their segregation as objects of sanctity under the guise of tribal totems. After men became herdsmen and tillers they realized the need for establishing relations with the powers on whose goodwill—rather than on that of the herds and crops themselves—their livelihood was seen to depend. Animal-worship and tree-worship accordingly passed

into that of the phenomena behind them, including rivers and wells, mountains and rocks, storm and rain, thunder and fire, moon and sun. *Consult* Introduction to the History of Religion, F. B. Jevons, 3rd ed. 1904; The Golden Bough, J. G. Frazer, 3rd ed. 1907-15.

**Naucratis.** Ancient Greek colony in Lower Egypt. Situated near the modern Nebira on the Canopic arm of the Nile, it was founded by traders from Miletus in the 7th century B.C. Under Aahmes II, c. 564 B.C., it monopolised Greek trade in Egypt. The site was identified by Petrie in 1885 and excavated by him, further work being done by Hogarth in 1899.

**Naugatuck.** Borough of Connecticut, U.S.A., in New Haven co. It stands on the Naugatuck river, a source of water-power, 15 m. N.W. of New Haven by rly. Goodyear, who discovered the rubber vulcanisation process, established a factory here in 1843, and it has one of the world's largest rubber regeneration plants. Leading industry is rubber products, one plant making 100,000 pairs of footwear daily. Other manufactures include chemicals, plastics, aeroplane instruments, iron castings, and glass. Settled in 1702, the town was incorporated as a borough in 1893. Pop. 15,388 (approx. one-third being foreign-born).

**Naughton and Gold.** British music hall comedians. Charles John Naughton was born in Glasgow, Dec. 15, 1888, and James McGonigal (who adopted the name of Gold) was born April 21, 1886. Natural comedians and notorious practical jokers off the stage, they played in pantomime and scored a great success when they appeared with the Crazy Gang in a series of burlesque turns from 1931.

**Nauheim, BAD.** Town and watering-place of Germany. It is in Hesse, 16 m. N.E. of Frankfurt-o-M. For long it was Germany's outstanding spa for cardiac disorders, having saline waters rich in iron and carbon dioxide. Gout, rheumatism, and many skin ailments have also been treated here. The sources were used in Roman times, but the spa was inaugurated only in 1835. After the end of the Second Great War it came within the U.S. zone of occupation. Pop. (pre-war) 9,390. *From* Now-hime.

**Naumburg.** Name of several German towns. The most important is Naumburg an der Saale,

in the *Land* of Saxony-Anhalt, which after the Second Great War came in the Russian zone of occupation. In the main a medieval town, it was in the early 20th century the home of various industries, including textiles, toys, and paper manufacture. The Protestant cathedral, dating from the 12th and 13th centuries, is noteworthy for its four towers and for the 12 life-size statues of the founders. Other interesting buildings are the churches of S. Wenceslaus and S. Mary. The town was the seat of a bishopric from 968, and from the 13th to the 15th century a member of the Hanseatic League. In 1564 it passed to the electors of Saxony, and it remained Saxon until handed over to Prussia in 1815. Pop. (pre-war) 31,000.

Two other Naumburgs are in Silesia: Naumburg an der Bober (Pol. Nowogród Bobrzański), near Liegnitz, has iron sulphide mines; and Naumburg am Queis (Pol. Nowogrodziec) makes pottery.

**Naupaktos** (mod. Lepanto). City of ancient Greece, in the county of the Locris Ozolae, on the N. coast of the Corinthian Gulf. It had a good harbour, now almost entirely silted up. The Athenians settled Naupaktos with Messenians deported after the war with Sparta in 455 B.C., and used it as a naval base in the Peloponnesian war.

**Nauplia** or **NAVLIA**. Town and port of Greece. Anciently the

is 20 m. across its entrance and 30 m. long. Spezzia is the chief of numerous islands. The Xeria river on which Argos stands flows into it.

**Nauru**. Island of the Pacific. Its area is 5,263 acres and it is 400 miles from the Marshall Islands. Its importance is due to its rich deposits of phosphates. The island was annexed by Germany in 1888 but, having been taken by the Australian forces in 1914, was later governed by Great Britain under the League of Nations. On Dec. 27, 1940, Nauru was heavily shelled by a German raider, the phosphate plant being badly damaged. After the entry of Japan into the war, the island was bombed by Japanese aircraft and eventually occupied by Japanese troops on Aug. 25, 1942. U.S. aircraft and warships attacked Nauru during 1943-44, on several occasions. On Sept. 14, 1945, the Japanese troops surrendered to Australian authorities on board an Australian ship. Pop. 2,321.

**Nausea**. Medical term, derived from the Greek word for sea sickness. It describes the sensation of impending vomiting. It is a symptom of many diseases. *See* Vomiting.

**Nausicaa**. Ancient Greek heroine mentioned in the *Odyssey*, 6. She was the daughter of Alcinoos, king of the Phaeacians, and the shipwrecked Odysseus found her playing at ball with her maidens on the shore. Pitying his plight, she conducted him to her father, by whom he was hospitably entertained. *See* *Odyssey*.

**Nautch Girl** (Hind. *nāch*, dance). Indian dancer. These girls are carefully chosen for their beauty when young to be priestesses to the god Rondzu, the fifth daughter being supposed to be specially suitable. Apart from their dancing in the temples, they are hired to amuse guests by dancing and singing. The dance consists of posturing and slow steps, each part of the body being made to express emotion. The dancers' costumes are very rich, often covered with jewels. *See* Dancing.

**Nautical Almanac**. Publication containing tables and astronomical data for the use of seamen.

The best known is the British Nautical Almanac, while others are published by the U.S.A. and France. The British Nautical Almanac was first issued in 1767 under the superintendence of Maskelyne, then astronomer royal, and from 1832 by the Admiralty. It is usually issued two or three years in advance for the sake of mariners. The offices are at the Royal Greenwich Observatory, Hurstmonceux, Sussex.

**Nautiloidea** (Gr. *nautilus*, sailor; *eidos*, form). Fossil Cephalopoda. Remains of nautiloidea are found in Cambrian to present-day deposits. They were very similar in form to the existing nautilus (*v.i.*), the only remaining living genus of the order. *See* Cephalopoda.

**Nautilus**. Genus of cephalopodous (head-footed) molluscs, related to the cuttles, but having

**Nautilus**. Sectional diagram of interior of shell of pearly nautilus. a. Mantle; b. Dorsal fold; g. Muscle attaching body to shell; i. Chambers of shell; k. Funnel; n. Hood; p. Fringed lobes surrounding mouth; s. Eye; x. Shell and septa; z. Newest chamber

a spiral chambered shell. It is distinguished from all other cephalopods by having four gills instead of two. It lacks the tentacles of the cuttles, but has fringed lobes round the mouth. The diagram shows the coiled shell in section, the animal filling only the newest or outer chamber, the remainder containing gas. Thus the animal is buoyant in water and can move easily, crawling on its foot rather like a snail, and feeding upon other molluscs and small crustaceans. It is also able to swim like the cuttles in a series of backward jerks by expelling water from its siphon.

There are probably only three living species of nautilus, of which the pearly nautilus is the best known. It gains its name from the beautiful, white, pearly shells, valued by collectors, but in the living state the exterior of the shell is dull and porcellaneous, the colour pale brown with broad bands of darker brown. Internally the shell is remarkable for its

**Nautch Girl**. Punjabi dancing girls from Delhi, with their musicians

port of Argos, 6 m. N.W., it lies on the N.E. side of the gulf of the same name, and has a fair shipping trade. In the Middle Ages it belonged to Venice. It passed to the Turks, from whom it was taken by the Greeks in 1822, and was their capital until 1834. The rly. from Corinth runs to the head of the gulf. Pop. est. 8,000.

**Nauplia**, **GULF OF**. Arm of the Aegean Sea, Greece. It lies between two peninsulas of the Morea,

division by septa or thin walls into a series of chambers which mark stages in the growth of the animal. The nautilus occupies the outermost chamber only. The others are united by a slender tube or siphuncle which extends to the apex of the shell. On some parts of the coast of India the flesh is salted and dried for food.

The nautilus is of interest to the palaeontologist as being a survival of a large group of fossils, the Ammonites. It is found only in the Indo-Pacific ocean at depths below 10 fathoms, though empty shells are washed ashore in abundance. See Cephalopoda.

**Navaho** or **NAVAJO**. N. American Indian tribe. They live mostly on reservations in New Mexico and Arizona. Of Athapascan stock, they number about

Navaho. Squaw (above) and man from Arizona

28,500. Their arid pasture-lands, averaging 6,000 ft. in alt., have been improved by irrigation, and are under partial cultivation. They are skilful weavers. Their belief in a nature-goddess, "she-who-grows young," puts womanhood on a high plane. Consult The Navaho, Kluckhorn and Leighton, 1947.

**Naval Architects**, INSTITUTION OF. British technical society. Founded in 1860, it holds meetings for the discussion of ship design and general questions of interest to members. Transactions are published quarterly. Offices: 10, Upper Belgrave St., London, S.W.1.

**Naval Aviation**. Title of the aviation branch of the Royal Navy. It replaced the title, Fleet Air Arm (q.v.) on Sept. 9, 1946.

**Naval Brigade**. Name for a body of sailors landed from a fleet to fight on shore. Famous brigades of this kind were the naval brigades of the Shannon and Powerful, which helped to defend Ladysmith during the South African War, and the mixed naval and marine brigades who were sent to assist in the defence of Antwerp in Oct., 1914. (See Antwerp.) In the Second Great War the functions of naval

brigades were performed by Royal Marine commandos.

**Naval Cadet**. Name given to boys training for commissions in the Royal Navy. Candidates, who had to be 12½ years old, were formerly nominated by the first lord of the Admiralty, and all training was carried out in warships at sea until the early 19th century. With the introduction of steam and the establishment of shore training establishments there was considerable distinction between cadets entering for the executive and engineering branches. In 1903 the system of nomination was abolished, as was the distinction between branches. The first two years of training were spent at Osborne and the next two years at Dartmouth, but in 1921 Osborne was closed and the cadets transferred to Dartmouth.

The first lord selected candidates from a committee's recommendations, subject to their passing a qualifying examination. At Dartmouth the education was on public school lines. After passing out cadets joined ships of the Mediterranean or Atlantic fleets, becoming midshipmen after eight months afloat.

In March, 1948, the Admiralty introduced a new system. Candidates just over 16 years old, who come from all types of schools, sit for an examination held three times a year. Entry into the Royal Naval College, Dartmouth, is free, as are tuition and maintenance. Parents pay for cadets' uniforms and personal expenses according to their means. There is no charge upon parents whose income is less than £300 a year. Cadets spend six months at Dartmouth, followed by eight months on a training cruiser before going to the fleet as midshipmen. Approx. 120 cadets enter Dartmouth each year.

**Naval Discipline Act**. Act codifying the immemorial customs and the statutory provisions governing the maintenance of discipline in the Royal Navy, formally described as 29 and 30 Vict. C. 109. It was amended by the Naval Discipline Act of 1922 (12 and 13 Geo. 5. C. 37). See Royal Navy.

**Naval Division**, ROYAL. For details of this body, see under Royal Naval Division.

**Naval Prize Bill**. British Act of parliament which governs the computation and distribution of naval prize money. The largest amount of prize money ever awarded for a single action was the £520,000 distributed to the frigates Active and Favourite for their

capture of the Spanish vessel Hermione in 1752. After the First Great War the Naval Prize Bill was amended: instead of the prize money being awarded to ships' crews directly concerned in the action, all prize money was paid into a common fund and shared among all personnel of the navy according to rank. The total sum distributed was £9,500,000. The bill was further amended after the Second Great War to include within its scope personnel of Coastal Command of the R.A.F. Prize money of the Second Great War totalled some £12,000,000, but distribution, which averaged £25 per man, did not begin until some years later. This was the last distribution of the traditional bounty. See Prize Court; Prize Money.

**Naval Reserve**, ROYAL. Details of this body, and of the Royal Naval Volunteer Reserve, will be found under Royal Naval Reserve.

**Navan**. Market town and urban dist. of co. Meath, Eire. Standing where the Blackwater falls into the Boyne, it is a junction on the Eire state rlys., 30 m. from Dublin. A market town, surrounded by rich agricultural land, it is also an industrial centre, manufacturing carpets, woollen goods, and agricultural implements. Tara, ancient residence of Irish kings, is 6 m. S.E. Until 1800 Navan sent two members to the Irish parliament; since 1935 Dáil representation has been merged in the cos. Meath and Westmeath. Market day, Wed. Pop. 4,123.

**Navarino**, BATTLE OF. Destruction of a Turkish fleet by the British and their allies, Oct. 20, 1827. It was the decisive battle of the Greek War of Liberation. Egyptian forces, under Ibrahim Pasha, had landed in the Morea in 1825, while the Greek fleet had lingered too long in the Cyclades. Ibrahim inflicted a terrible military defeat upon the Greeks, and established himself at Navarino, whither a combined Egyptian and Turkish fleet transported reinforcements from Crete. A little later a large fleet arrived, bringing fresh strength from Egypt. Meanwhile an allied squadron proceeded to Navarino, Oct. 20, 1827.

It was hoped that the Turks would enter into negotiations, but the situation had become so tense that when a British boat was fired upon the whole line burst into flame, and a furious fight raged at the closest quarters. Probably no battle had ever been more speedily decisive. The next morning Codrington wrote: "Out of a

fleet composed of 81 men-of-war, only one frigate and 15 smaller vessels are in a state ever to put to sea again.' The battle was tactically complete, and strategically decisive. Navarino, now called Pylos, is a seaport in the Morea, with a fine harbour. See Pylos.

**Navarre.** Former kingdom of S.W. Europe. Its territory lay on the western borders of France and Spain at the angle of the Bay of Biscay; and it included the W. part of the Pyrenees with a small part of Gascony and a varying area in Spain. The population was mainly Basque. When the Saracens conquered most of Spain in the 8th century, the Gothic Christian nobles held their ground in the northern mountains.

The strongest kingdom thus established in the early years of the 11th century was that of Sancho the Great, king of Navarre, who died in 1035. A hundred years later, under Alphonso I, Navarre seemed likely to absorb the Christian monarchies. In 1234, however, the crown passed to Theobald, count of Champagne, a feudatory of France, and in 1284 Navarre became an appanage of the French crown by the marriage of King Philip IV with its heiress. On the death of Louis X, 1316, Navarre passed to his daughter and then to her son Charles the Bad, being again parted from the French crown, which passed by male succession only.

In the 15th century the crowns of Navarre and Aragon were united by the marriage of Blanche of Navarre to John of Aragon; on his death, in 1479, Aragon went to Ferdinand, his son by a second marriage, while Navarre was claimed by Catherine of Foix, his grand-daughter by the first marriage. Catherine married the French Constable, Jean d'Albret, and retained French Navarre with the royal title, while Ferdinand annexed Spanish Navarre. Her daughter, Jeanne d'Albret, married Antony of Bourbon, and was the mother of King Henry of Navarre, who succeeded to the French throne as Henry IV in 1589—the first of the Bourbon kings of France. In 1620, eleven years after his death, French Navarre ceased to have the status of a kingdom.

**Navarre, OR NAVARRA.** Frontier prov. of N. Spain, bounded N. by France and sloping S. to the Ebro. Traversed by the Pyrenees and the Cantabrian Mts., it is almost wholly mountainous, reaching in Mt. Adi an alt. of 4,930 ft. Excepting the Bidassoa, which

flows N. to the Bay of Biscay, the rivers run S., falling into the Ebro. On the hills, pine, beech, oak, and chestnut forests abound; the valleys are fertile, yielding cereals, flax, wine, and oil. Sheep and cattle are reared on the grassy uplands, and game and freshwater fish are abundant. The chief exports are livestock, wine, oil, wool, leather, and paper. The principal towns are Pamplona, the capital, and Tudela. Its area is 4,056 sq. m. Pop. 383,359.

**Navarrete, BATTLE OF.** Fought between the English under the Black Prince and the Spaniards, April 3, 1367.

The Black Prince entered Spain in the interests of Pedro the Cruel, king of Castile, with some 30,000 English, French, and mercenary troops. The Spaniards, under Henry of Trastámara, joined battle at Navarrete, a village near the French frontier. The English were in three lines, the first under Sir John Chandos, and they fought dismounted with archers on their flanks. The first of the Spanish lines, also dismounted, was under Du Guesclin. At first the English were forced back, but their archers came to the rescue, the prince hurried up his reserves, and soon the Spaniards were in flight, pursued by the English. The battle is described by Froissart.

**Nave** (Lat. *navis*, a ship). In ecclesiastical architecture, the largest, i.e. the middle, section of a church divided by piers or columns into three parts. As such the nave includes the choir and the height of the clerestory, but when the choir is shut off from the body of the church, it is commonly excluded from the term nave. See Basilica; Cathedral; Choir.

**Navel.** Scar in the centre of the abdomen, which marks the spot where the umbilical cord (*g.v.*) has been severed at birth, and, in human beings, tied.

**Navicert.** Permit issued in time of war by a blockading power to allow legitimate cargoes to pass through contraband-control areas. Introduced by the British in 1915, it was, in effect, a commercial passport for goods, and was issued by British representatives before such goods left a neutral port of shipment for a neutral destination. Firms requiring navicerts inquired from the British embassy or legation if the proposed shipments would be regarded as purely neutral. If the British representative knew the consignee to be trustworthy, and the goods as such did not require a British

export licence, a navicert was issued. Thus delay and inconvenience in passing through contraband control were reduced to a minimum. The first navicerts of the Second Great War were issued on Nov. 22, 1939, and were made available between the U.S.A. and certain neutral countries near Germany. Navicerts were discontinued from Sept. 30, 1946.

**Navigation.** Art of directing a ship or aircraft from one position to another and of determining its position at any moment. In marine navigation a chart and a mariner's compass are required. Before the invention of the mariner's compass, mariners were compelled to keep in sight of land.

In order to determine the course between two positions, charts have been drawn of different portions of the globe. These charts have the latitude and longitude and the true or magnetic north marked on them. The present position of a vessel and the one it is desired to reach are plotted on the chart, which thus gives the course to be made good. The direction of this course is read off from the points of the compass pointed on the chart. To discover from the chart the course to be steered in order to arrive at any desired position, the mariner must know the position of his vessel. In sight of land this is easily found by taking compass bearings, i.e. the direction by compass of prominent objects such as a lighthouse, or church spire. The position of these objects is shown on the chart. Three or more objects are selected, so that the compass bearings cut one another at a fairly large angle when shown on the chart. Through each object on the chart is then drawn the observed compass bearing, and the point where these lines cut is the position of the ship at the time of observation.

For example, a mariner observes that the summit of a hill bears N.W., a church spire N. 10° W., and a lighthouse N. 40° E. The ship's position is where the three lines cut as shown in the figure:

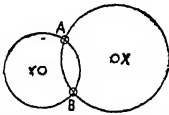

When out of sight of land, the approximate position at any time can be found by calculating the number of nautical miles the vessel has travelled along the course from the last-known posi-

tion and then plotting this distance on the chart. Such an approximate position is called dead reckoning (D.R.). If the effects of currents and tidal streams, wind, weather, and other factors are taken into account, the position is called an estimated position (E.P.).

The exact position of a vessel when out of sight of land is obtained by observation of the heavenly bodies. Observations of stars or planets give the most accurate results, and are normally made during the morning and evening twilight. Several are usually visible at the same moment, but observation is difficult for a novice. On large aircraft, such observations are made by the navigator through a transparent cover fitted to the roof of the fuselage.

A sextant and a chronometer showing Greenwich time, or a known error on Greenwich time, are required for taking an observation. The altitude of the heavenly body is measured by the sextant and the time is noted at the instant the altitude is observed. The observer obtains the actual distance of his position from the point where, at the instant of observation, an imaginary line joining the centre of the earth and the heavenly body cuts the earth's surface. This imaginary point on the earth's surface is known as the geographical position of the heavenly body. The observer then knows that he is on a circle whose centre is the geographical position of the body observed, and whose arcual radius is the observed altitude. Another circle can be drawn for another star observed simultaneously, or for the same body after an interval of time. The ship's position is then at one of the points of intersection of the circles. 

Navigation. Diagram showing the geographical positions *X, Y*, of two heavenly bodies, and *A, B*, the points of intersection of circles giving the position of a ship.

In practice it is not usually possible to draw the circles owing to the excessive length of the radii, so the following method is adopted. The altitude is observed at any moment and the Greenwich time noted. The D.R. position is calculated at this moment. Supposing the ship to be at the D.R. position, the altitude of the heavenly body observed can be calculated trigonometrically, as can also the direction, i.e. the bearing by compass.

Thus three factors are known: (a) The observed altitude, which must be correct, as the observer has measured it with his sextant. (b) The calculated altitude which is only correct provided the ship is in the D.R. position. (c) The direction of the heavenly body. The D.R. position is put on the chart and through this position the direction of the heavenly body is drawn. The difference between the observed and calculated altitudes is noted, and from this on the chart the true position is obtained, drawing what are known as position lines. This method is that commonly used by mariners.

Navigating in the air is in general similar to that of navigating a ship, but is influenced by a number of differing conditions. Air speeds are much higher than sea speeds, and great rapidity and accuracy are required. The air navigator does not have to consider dangers comparable with rocks and shoals; consequently the seaman's need for accuracy of position is not so important for an aircraft; on the other hand, a greater degree of accuracy of time is essential in the air. The effect of wind on an aircraft is similar to that of tides and currents on a ship, both producing angles of drift; but in the case of aircraft a much greater displacement off course is effected in a given time. The principal instruments used in aircraft navigation are: compass, drift indicator, directional gyro, and calculator for the vector triangle—these ensure the desired course being maintained; air speed computer, air speed indicator, sight for observation of ground speed, which, used in conjunction with the altimeter and height computer, enable the height of the ground above sea level to be computed from the map—these instruments determine distance run; a compass for observation of bearings or fixing the direction of objects the position of which is known and recognizable from the map, altimeter for determining the altitude of the aircraft above ground level, sextant for observing the sun, moon, and stars, so fixing geographical position; a watch to give the exact G.M.T. of the astronomical and observational tables—these fix the position of the aircraft. Both ships and aircraft use radio direction-finding for establishing position, but such instruments require the cooperation of land or shore stations. Position can also be established by radar (*q.v.*), which is playing an

increasing part in modern navigation. Radio and radar aids have the great advantage of being available throughout the day and night and are unaffected by weather conditions.

Navigation of land vehicles, which was a feature of the mechanised operations in the desert in the Second Great War, is generally done by means of map and compass. It is much more simple than air or sea navigation, as there are usually recognizable landmarks to assist in fixing position. *Consult*: The Complete Observer's Astro-Navigation, F. Chichester, 1944; The Theory of Navigation, W. Alexander, 1944; Elementary Marine Navigation, S. Walling and J. Hill, 1944; A History of Air Navigation, A. Hughes, 1946; Admiralty Manual of Navigation, published annually.

**Navigation Acts.** Term applied to a number of enactments designed to regulate shipping to the advantage of British ships. Such legislation is to be found in the reigns of Richard II, Henry VII, and Elizabeth, but Cromwell's Navigation Act of 1651 was the first comprehensive enactment. This Act, directed against the very profitable Dutch carrying trade, refused admission into English ports of all goods not carried in English ships, or in the ships of the country of origin, while English goods could be exported only in English vessels. It benefited English shipping, but it raised the price of imports and caused a war with the Dutch. Enactments in 1660 and 1663 forbade colonial trade to any but English ships, a restriction destined to be a great source of trouble with the American colonies. The Acts were completely repealed in 1849, and in 1854 even the coastwise trade was thrown open.

**Navigators' Islands.** Original name of the islands in the Pacific Ocean now known as the Samoan Group (*q.v.*). They were so named by their discoverer, Louis Antoine de Bougainville, 1768.

**Naville, ÉDOUARD HENRI** (1844-1926). Swiss Egyptologist. Born at Geneva, June 14, 1844, he studied in Geneva, London, Paris, and Berlin. In 1869 he proceeded to Egypt, where from 1883 onwards he carried out important excavations, partly on behalf of the Egypt Exploration Fund. They included the store-city of Pithom, Goshen, the city of Onias, and the temple of Deir-el-Bahri. His translated works include The Old Egyptian Faith, 1909; Archæ-

ology of the O.T.; Was the O.T. written in Hebrew? 1913. He died Oct. 17, 1926.

**Navsari.** Dist. and town of Bombay, India. The dist. is crossed by the Tapti river. Fruits, sugar, grain, and cotton are produced. The town, which stands on the left bank of the Puma, 149 m. N. of Bombay, can be reached by small ships. The Zoroastrian priesthood of the Parsees receive their initiation and training at Navsari, which has been a centre of the Parsees since their arrival in India. Area, 1,811 sq. m. Pop., dist., 466,000; town, 45,000.

**Navy.** Name applied to a labourer employed on road making or other digging operations. The word is an abbreviation of navigator, the term applied in the late 18th and early 19th centuries to a labourer employed in digging canals. It was later applied to unskilled labourers on roads and railways. A steam navy is a machine for digging. See Excavator.

**Navy** (Lat. *navis*, ship). Term used for the collection of men and ships that form the force a country maintains for fighting at sea. Originally it described all a nation's vessels, whether used for trade or warfare. At the present day, practically every country which has a seaboard has a navy, although a number of them are of little value as fighting units.

The first navy of note was that of Athens, although as early as 664 B.C. both Corinth and Corcyra had fleets of fighting ships, as a little later had nearly all the little states of Greece. The Persians and Egyptians had fleets about this time, and the battle of Salamis was fought in 480 B.C. between the Persians and a navy composed of ships supplied by Athens and her allies. The Athenian navy, which owed much to Themistocles, appears to have been well organized, with an efficient and trained personnel, and its services to Athens and her allies during the Peloponnesian War gave the world its first great lesson in the value of sea power. Unlike the European navies of the 16th century, it was a collection of vessels, the long ships, maintained by the state solely for fighting purposes, not one assembled hastily from various ports and owners to meet an emergency.

Rome and Carthage had each a navy of considerable size, and one was established for the eastern empire. Much of their work consisted in the suppression of pirates, who then, as later, swarmed in the Mediterranean. Partly for the

same reason navies were maintained by Venice, Genoa, and other trading states. The later navies of modern European powers arose from the few vessels maintained by the sovereigns. Spain had, early, a considerable navy, while England and the Dutch republic soon made reputations on the sea. Scotland and France were among other countries that possessed small royal navies in the 15th century, as did Portugal and Denmark. Somewhat later, Frederick William laid the foundation of the navy of Prussia, and Peter the Great rendered a like service to Russia.

#### From Merchantman to Warship

There was in early navies no sharp distinction between a warship and a merchantman. The merchantman was, of necessity, always ready to fight, and the navy was simply a collection of these, after extra men and arms had been provided, reinforced perhaps by a few vessels built more especially for fighting purposes. In the 18th century navies came to consist of ships built solely for fighting, and it was such that fought the battles of the Napoleonic period.

For many years after Trafalgar there was little change in the essentials of the world's navies, but in the second half of the 19th century began the evolution of the modern navy and of specialised vessels.

As regards navies in general before the First Great War, the tendency was to look at them from the point of view of relative strength. The British navy had long been unquestionably stronger than any other taken singly, but its directors were forced to consider the possibility of a combination against it. Thus was evolved the two-power standard, i.e. the theory that the British navy should be equal to the next two combined. The two-power standard was maintained against France and Russia, but the rapid growth of the German navy imperilled it.

After the First Great War the principal naval powers made plans for maintaining greatly expanded fleets, and the end of hostilities had left Great Britain and the U.S.A. with large numbers of new warships of all types laid down during the war. Eventually, however, a series of international treaties, of which the Washington agreement of 1922 was the first, restricted building, particularly in heavy categories, such as battle-ships and cruisers. These treaties gave the U.K. and the U.S.A.

parity, the next strongest fleet being the Japanese on a ratio of five to three.

Although they did much to stem naval competition, the terms of the agreements led to considerable ill-will among the signatories; notably, between the U.K., the U.S.A., and France on the one hand and Italy and Japan on the other. Moreover, as was later proved, the restrictions were deliberately evaded, especially by Japan. By the Versailles Treaty, Germany was forbidden to build or maintain warships in excess of 10,000 tons, or any submarines. With the establishment of the Nazi regime, these stipulations were openly disregarded, and even the so-called pocket battleships of 10,000 tons were, in fact, nearer 15,000 tons.

#### Importance of the Battleship

Development of the submarine in the First Great War had suggested that the day of the big battleship was over, but new underwater defences restored the capital ship's importance, and in the Second Great War it was still the decisive factor in naval warfare. Aircraft were little used in the First Great War, but later the development of the ship-borne bomber and torpedo-carrying aeroplane inspired a general belief that the battleship could not survive air attack. Here, again, events disproved theory, and battleships operated efficiently and decisively even in narrow waters, such as the Mediterranean, provided they themselves had air cover. The battleship and the aircraft carrier, in fact, became complementary.

Because of the necessity of sailing in convoy, modern navies are obliged to devote much of their total tonnage to small escort vessels. Navies and mercantile marines in wartime now form almost a single service. In Great Britain this has raised the status of the mercantile marine, a fact recognized by officially designating it the Merchant Navy. As a result of experience gained in the Second Great War, the modern wartime merchantman has reverted in some ways to the type existing until the beginning of the 19th century, being heavily armed. The merchant aircraft carrier even carries its own fighter aircraft.

Comparative naval strength was radically altered as a result of the Second Great War. In 1939 the British navy was by a considerable margin the most powerful afloat. By the end of hostilities,

Italy, Germany, and Japan had ceased to be of any naval consequence, while Great Britain drastically reduced her fleet. The U.S.A. had built great numbers of warships of all types during 1938-45, and although she too demobilised many ships and personnel, she was in 1948 the world's dominant naval power. In the years immediately after the Second Great War none of the naval powers built any large warships, as much uncertainty existed as to the effect of atomic weapons and guided missiles. See Aircraft Carrier; Cruiser; Destroyer; Merchant Navy; Royal Navy; Sea Power; Submarine. Consult Brassey's Naval Annual, 1886, foll.; All the World's Fighting Ships, Jane, 1898, foll.; World War at Sea, Tunstall, 1943.

**Navy Board.** Former department of the British naval administration. It dates from the reign of Henry VIII, and was that part of the board of admiralty responsible for civil administration, including the work of shipbuilding, dockyards, etc., as distinct from the office of lord high admiral. The organization was changed from time to time, but the divided control was maintained. Samuel Pepys (q.v.) was secretary to the Navy Board 1665-1679. In 1683 the work of victualling the fleet was taken from the navy board. This divided control came to an end in 1831, when both the navy board and the victualling board were abolished as distinct departments, and came under the direct control of the admiralty. In the U.S.A. the department of the navy which corresponds to the British admiralty is sometimes known as the navy board. See Admiralty, Board of.

**Navy League.** British society founded in 1895 for the purpose of arousing and maintaining interest in the navy, and keeping it strong and efficient. The league carries on propaganda by means of lectures and publications in all parts of the British dominions, and is responsible for the organization of the Sea Cadet Corps (q.v.). It publishes a monthly journal *The Navy*. Its office is at Grand Buildings, Trafalgar Square, London, S.W.1.

**Navy List.** Official handbook of the British navy. It was first issued in 1814, and has been published monthly almost ever since. It gives in normal times the names of all officers in the different branches of the service, and also the names of all H.M. ships and the services they are engaged upon. The quarterly *Navy List*

contains full information about the various admiralty departments, in addition to the details published in the monthly lists. Both the monthly and quarterly lists have ceased to be on public sale since 1939.

**Navy Week.** Week during which the public are allowed to inspect British warships at certain home ports. In 1928 a committee of naval officers and men received Admiralty authority to hold a week's public display of naval activities at Portsmouth, Plymouth, and Chatham, the proceeds to be allocated among a number of naval charities. In 1932 a permanent executive staff was formed. With the exception of these salaried posts, Navy Week is on a strictly voluntary basis. It is generally observed in the first week in August, to coincide with the dockyard holiday, and realizes an average of £25,000 from the three ports; £8,000 of this goes to a trust fund, the remainder being distributed among hospitals and orphanages catering for all ranks of the Royal Navy. Interrupted by the Second Great War, Navy Week was revived in 1948.

**Navy Yard.** Term used in the U.S.A. to describe naval dockyards where ships are overhauled and supplies of stores and victuals maintained. The principal naval yards are Brooklyn on the Atlantic and Seattle on the Pacific coast.

**Nawanagar.** A former Indian state, now the leading entity in the amalgamation of Kathiawar states known as Saurashtra. It occupied the N.W. of the Kathiawar peninsula, with a coast-line on the Gulf of Cutch and the Little Rann of Cutch. Native food grains and wheat are grown. Area 3,791 sq. m. Pop. 504,006. The town, also known as Jamnagar, is a port on the Gulf of Cutch, on the N.W. coast of the Kathiawar peninsula, 160 m. W.S.W. of Ahmadabad; it contains cloth factories and has a pearl fishery. It is a rly. terminus. Pop. 71,588. See Ranjitsinhji.

**Naxos or Naxia.** Largest island of the Cyclades group, in the Grecian Archipelago. It has a length of 21 m. and a breadth of 15 m.; area about 175 sq. m. Mountainous, picturesque, and fertile, its culminating point is Mt. Zea, alt. 3,300 ft. It is noted for wine, and also produces cereals, oil, fruit, cotton, and emery. Its marble quarries have been worked ever since the 6th cent. B.C. The capital is Naxos, a seaport city on the N.W. coast;

it has an old castle, a remnant of the Venetian period, when, with neighbouring islands, it formed a Venetian dukedom; it was captured by the Turks in 1566. Colonised by Ionians, about 1000 B.C., it suffered in the Persian wars before joining the Athenian league. Off Naxos, 376 B.C., the Athenians utterly defeated the Spartans in a naval engagement.

**Nayar or Nair.** People of the Malabar coast, S. India. The Narae of Pliny, situated between Point Dely and Cape Comorin, they number approximately 1,000,000. A community rather than a caste, with exogamous clans, they retain various matriarchal customs, matrilineal descent, and a form of union, *sambandham*, which involves no marital obligation and no dowry. This received government recognition in 1896.

**Nayarit.** State of Mexico. It is centrally placed on the Pacific coast, and is backed by the Sierra de Nayarit. The chief river is the Santiago or Rio Grande de Lerma. The principal products are wheat, sugar, tobacco, coffee, and palm oil, and gold, silver, and lead are mined. Tepic is the capital. Area 11,300 sq. m. Pop. 216,698.

**Nazarene.** Term used in the N.T. In Matt. 2, v. 23, it is said that Joseph went and dwelt in a city called Nazareth, "that it might be fulfilled which was spoken by the prophets, that He (i.e. the Messiah) should be called a Nazarene." The particular words spoken by the prophets have not been preserved in the O.T. as we have it, unless the writer in some way identifies Nazarene with Nazareth (cf. Judges 13, v. 5, "the child shall be a Nazarite, and shall begin to save Israel"). In any case, in Matt. 2 the primary meaning of Nazarene is taken to be "a dweller in Nazareth," and Jesus is often so described (Mark 1, v. 24; Luke 18, v. 37; John 19, v. 19; Acts 3, v. 6, etc.). Nazareth being a small place, the term Nazarene was sometimes, though not always, used in scorn. At Antioch the first Christians were called Nazarenes, and they continued to be so called by the Jews (Acts 11, v. 26). In Acts 24, v. 5, S. Paul is called "a ring-leader of the sect of the Nazarenes."

The term Nazarene was applied to a group of German religious painters of the early 19th century. See Overbeck, F.

**Nazareth.** Town in Galilee, situated on the slope of a hill halfway between the Lake of Galilee and the sea. Now known as

Nazareth. General view of this town in Galilee from the hills to the north-west

En-Nasira, it is famed as the early home of Christ, and the surrounding district is notably fertile. Nazareth was occupied by British forces, Sept. 20, 1918. Pop. 14,200.

**Nazarites** or **NAZIRITES**. Word meaning separated, and applied to certain Jews. These devoted themselves to the service of God, abstained from wine and all products of the grape, allowed their hair to grow long, and avoided contact with dead bodies. Samson and John the Baptist were con-

secrated Nazarites from their birth; but as a rule the vow was only temporary, usually taken for a month, at the termination of which period certain sacrifices were offered, and the head was ceremonially shaved. The Law of Moses prescribed certain regulations concerning it (Num. 6).

**Naze**, **THE**. Headland of Essex, England, 5 m. S. of Harwich. See Walton-on-the-Naze.

**Nazimuddin**, **KHWAJA** (b. 1894) Pakistan statesman See N V

## NAZISM OR NATIONAL SOCIALISM

Edgar Stern-Rubarth, Ph.D.

*The origins, development, and method of government practised by the German Nazi party, as well as the "theory" of Nazism, are here described. A brief account of the steps taken by the Allies to destroy Nazism after the German surrender in 1945 follows. See also Fascism and biographies of Hitler and other Nazi leaders*

Nazism, or National Socialism, was a political movement in Germany, 1923-45, which had offshoots in some neighbouring countries. One of the many local political groups that arose after Germany's defeat in 1918 was a so-called German workers' party, formed 1919, in the back room of a Munich beerhouse. Hitler, demobilised and unemployed, was being used at this time as a spy and agent provocateur to watch subversive movements after the sanguinary suppression of an attempt at forming a Bavarian soviet republic. He found the German workers' party receptive of his ideas and oratory, joined it as member No. 7, and, together with other unemployed or disgruntled men, built it up into a violently revolutionary, aggressive, and noisy political body. On July 29, 1921, he took the place of the former chairman, Drexler, renamed the party *Nationalsozialistischen*

*Deutschen Arbeiterpartei* (N.S.D.A.P., National Socialist German Workers' Party), and proclaimed the principle of the *Führer*: one man in supreme authority, to whom unflinching fealty was sworn by all his followers.

Hitler also advocated a military discipline, and racialism—a violent, primitive anti-Semitism coupled with exaggerated praise of the German, or Nordic, "master race." A number of other principles compiled in 1927 in the party's programme written by Gottfried Feder, such as the "abolition of the thralldom of interest," were dropped when the Nazis assumed power.

In foreign politics three main ideas soon emerged from the rather nebulous demands and promises by which Hitler inspired his audience: abolition of the "enforced" Versailles treaty, which he described as unfair, signed by traitors, and at pistol-point;

negation of all pacifist movements, including the League of Nations, as contrary to the heroic foundation of all life and progress; and acquisition by the sword (since there was no other way) of *Lebensraum* (living space) in the east for the German people. With these ambitions, the Munich Nazi party found, at an early date, allies and confederates in a similar extremely nationalistic and anti-Semitic movement among diehard conservatives in N. Germany, the *Deutschvölkische Freiheitspartei*, established 1920; further, Hitler gained the support of Ludendorff. Though noisy in their attacks on "Marxists" and other supporters of the Weimar republic, these parties had a membership counted at best by tens of thousands; and many who went to hear Hitler's speeches, now in larger beer-cellars such as the famous Hofbrauhaus, did so for amusement.

### The Munich "Putsch"

The grave crisis, however, through which Germany went in 1923, when astronomic inflation deprived millions of their savings and turned the better part of the middle classes, virtually overnight, into proletarians, was the party's opportunity. A conflict arose in Sept., 1923, between the Bavarian general state commissioner von Kahr and the Reich in Berlin; and in the night of Nov. 8-9, 1923, Hitler undertook a "putsch" by which he hoped to bring the military contingent of Bavaria over to his side, and to march with it to Berlin to overthrow the government. The military commander, General von Lossow, and von Kahr, both of whom he had forced to be present at his public announcement, deserted him, however, and the troops were ordered to fire upon the demonstrators, at whose head were Hitler and Ludendorff, Goering and other leaders. Hitler escaped, 14 of his followers died, Ludendorff and many others were arrested, the party was dissolved. Hitler, captured later and sentenced to five years in Landsberg fortress, was released after less than a year upon his pledge never to try illegal means again. During this internment, which he shared with his young friend, the blindly devoted Rudolf Hess, he dictated to Hess the book *Mein Kampf*, the bible of the Nazis.

While he was in prison, the remnants of his party merged with the N. German racialist movement to form the *Nationalsozialistische Freiheitspartei*, headed by Gregor

Strasser, one of Hitler's earliest lieutenants, Ludendorff, and the former conservative von Gräfe. In that guise the Nazis contested, for the first time, a national election on May 24, 1924, and won 32 seats out of a total of 472. In the following election, Dec. 7, 1924, they held only 14 seats out of a total of 493. Released from Landsberg, Hitler re-established his own party in Feb., 1925, under its old name; Ludendorff broke with him, but most of the Reichstag members joined Hitler's Nazi party. This had adopted the red flag with the swastika, and the brown shirt; badges and ranks were introduced among the S.A. (*Schutz-Abteilungen*), originally simply defence groups for the protection of Nazi meeting-places against intruding and aggressive political adversaries.

#### Tolerance by the Army

This development of a paramilitary organization, while provoking severe criticism from abroad and repressive measures by the Berlin govt., was a clever move devised and organized by the retired captain Ernst Röhm, one of Hitler's earliest backers. For it secured benevolent toleration of the movement by the Reichswehr generals, who saw in it a useful reservoir of future conscripts, and enthusiastic support from millions of the impoverished middle class, and unemployed youngsters of the working class who, in the primitive uniform of the Hitler army with its stripes and badges, overcame the sense of inferiority provoked in them by increasing shabbiness of their clothes and their hopeless search for work. In the next general election, May 10, 1928, however, the Nazis secured only 12 of 491 seats. Their press campaign, from 1922 onwards, by the *Völkischer Beobachter* in Munich, directed by Hitler, edited by Rosenberg; from 1925 by the *Illustrierte Beobachter*, edited by Wilhelm Weiss, likewise in Munich; and from 1926 by the *Berlin Angriff*, edited by Goebbels, shocked the bulk of German readers by its recklessness; as did their public demonstrations and brawls with socialists, communists, etc., their brutality, and their increasing use of deadly weapons.

This last was the chief result of the creation, in 1925, of the S.S. (*Schutz-Staffeln*), protective squads—a physical élite of the S.A. clad in black, and assigned as bodyguards to Hitler and other leaders of the party, later to be developed

by Himmler as pretorians, political police, and executioners of the regime. But late in 1929 Dr. Alfred Hugenberg, leader of the *Deutschnationale* (conservatives), signed with Hitler a demand for a plebiscite against the Young plan (*q.v.*), and in so doing signed the death sentence of his, previously the second strongest, party. The demand for a plebiscite failed, but many who had previously been conservatives now joined the Nazi party. The world economic crisis, with its disastrous repercussions in Germany, likewise favoured the Nazis, and when Brüning's new cabinet, lacking a stable majority and backed reluctantly by Hindenburg, dissolved parliament and held another election on Sept. 14, 1930, the Nazis entered the Reichstag as the second strongest group with 107 seats out of 577. State elections in Thuringia (*see* Frick, W.) and in Brunswick had already opened the door for some of their leaders.

#### The Election of 1932

The chance to test the power of their "totalitarian" claim against the established powers in the Reich offered itself in the presidential election of 1932. In the first poll Hitler, made eligible by a trick, won 11.3 out of 37.7 million votes; in the second 13.4 out of 36.5 million. He was defeated by Hindenburg. Drastic measures to prevent another Hitler putsch followed; S.A. and S.S., as well as the Hitler Youth, an organization imbuing boys between 14 and 18 with the Nazi idea, were suppressed. Two months later, when Papen had succeeded Brüning, all these interdicts were cancelled, and a compromise with Hitler—himself bent upon gaining absolute power—was sought. An election on July 31, 1932, gave 230 out of 608 seats to the Nazis, now by far the strongest group in parliament, Goering becoming its speaker; yet, on Aug. 13, in a conference with Hitler, Hindenburg refused to entrust "that Bohemian lance-corporal" with the task of forming a cabinet. When Papen resigned, in Nov., his War minister General von Schleicher succeeded him and tried to win the backing of the still powerful trade unions; aware of their serious financial difficulties, he had dwindling confidence in the Nazis.

Papen and his friends in industry and high finance, still hoping to exploit Hitler for their own ends, supplied him with millions in this crisis (though another election on Nov. 6 reduced

the Nazis' seats to 196), and intrigues in Hindenburg's circle against Schleicher paved the way for the *Führer's* success. On Jan. 30, 1933, he was entrusted by Hindenburg with the formation of a cabinet, which would, it was understood, be a coalition of the bourgeois parties, with Papen as vice-chancellor and wire-puller.

#### Nazism in Practice

A great torch-procession of brown- and black-shirts, singing their blood-curdling battle-songs, inaugurated the régime which, without delay, began to put into practice the "philosophy" laid down for it by Hitler and Rosenberg: (1) the elimination, disfranchisement, and deprivation of rights and property, of the Jews; (2) the abolition of democratic or other electoral institutions; (3) the "stabilisation" of the peasantry by making their property inalienable by sale and indivisible (the "blood and soil" policy); (4) the abolition of Germany's federal institutions, and the introduction of centralised government with provincial governors—*Gauleiter*, or *Statthalter*—in the former *Länder*; (5) the abolition of traditional law, and its replacement by "sound popular feelings," i.e. Nazi arbitrary power; (6) the suppression of freedom of thought, speech, press, worship; (7) the creation, in the guise of employment for some seven million unemployed, of an ever increasing army, and a huge armament industry; (8) compulsory enrolment of children of both sexes from the age of 6 into Nazi training formations; (9) the elimination, by way of concentration camps, sterilisation, and progressively more drastic means, of all "anti-social elements"—especially political opponents of the Nazis; (10) corporate organization, under appointed *Führers*, of all branches of professional, economic, intellectual, artistic, etc. activity.

Fake elections and plebiscites, gradual suppression of all other parties, followed. It was impossible for anybody to secure work unless he belonged to a subsidiary organization of the party. Nearly every public office was duplicated by the creation of a corresponding party authority from the Reich cabinet downwards, so that the real power was exercised not by the state but by the party officials. Adversaries, or potential adversaries, besides being imprisoned, killed, or driven into exile, were deprived of their possessions by a cunningly devised

system of currency regulations that enforced the sale—to the party or its minions—of all their possessions or credits for a fraction of their value. The currency was manipulated also to provide cheap travel in Germany for foreigners, who often thus became accessible to Nazi propaganda, and to get foreign foodstuffs and raw materials at a favourable rate of exchange. Yet the system, after exploiting all such possibilities, could prolong a semblance of success and prosperity only by successful wars of aggression: a fact cynically revealed by Hitler in *Mein Kampf*, though then ridiculed by many in Germany and abroad.

Nazism borrowed the *Führer* principle, the coloured shirts, and the salute by outstretched arm from Italy's fascism; the secret police (*Geheime Staats-Polizei*, abbreviated Gestapo) from the Bolshevik O.G.P.U. or its tsarist predecessor, the Ochrana; the chosen people theory, racialism, from Jewish history; the claim of infallibility and a number of rituals, from the R.C. church; the "Nordic" obsession from French authors such as Gobineau and Vacher de Lapouge, and the British renegade Houston Stewart Chamberlain. Even the name of the party was borrowed from an earlier Austrian group which stood for anti-Semitism and reunion with the Reich, but was not totalitarian. An anti-capitalist trend, originally represented by some of Hitler's closest collaborators—e.g. the brothers Strasser—was dropped when success approached in 1930; its advocates were killed in the famous "purge" of June 30, 1934. A huge literature, forced into circulation for the benefit of the party and its leading members (Hitler, Goering, Goebbels, Rosenberg, Ley, Darré) attempted to present national socialism as a workable, systematic, and complete political thesis.

The number of party members was usually overrated; not including the members of affiliated professional organizations, obligatory for nearly everybody in Germany, they were at the end of 1925, 27,117; 1926, 49,523; 1927, 72,590; 1928, 108,717; 1929, 178,426; 1930, 389,000; 1931, 806,294; 1932, 1,414,975; 1933 and following years, between 3½ and four million.

**DENAZIFICATION.** After Germany's unconditional surrender, May 7, 1945, the Allies agreed at Potsdam, Aug. 2, 1945, that all

members of the Nazi party who had been more than nominal participants in its activities should be removed from public and semi-public office and from positions of responsibility in important private undertakings. The Allied control council in Berlin issued a proclamation Sept. 25 including an article "completely and finally" abolishing the National Socialist party and all its organs. The Nazi party was not tried by the international court at Nuremberg, but four of its organizations, the leadership corps, the Gestapo and *Sicherheitsdienst* (S.-D.), the S.S., and the S.A., were indicted as criminal, all except the S.A. being declared guilty, Sept. 30, 1946.

Allied tribunals, and later, on the Germans' own initiative, German tribunals, were set up in each of the Allied zones to try alleged Nazis. The Allied control council on Oct. 14, 1946, laid down five categories into which German adults could be divided: (1) major political and military offenders, including war criminals, members of the organizations which had been declared criminal, and politically dangerous persons; these on conviction were liable to the death penalty or lesser penalties up to imprisonment for life; (2) offenders including active party or governmental functionaries; (3) lesser offenders; (4) followers; (5) those exonerated.

#### End of the Trials

The French suspended all trials of mere followers in Nov., 1947. In the British zone denazification came officially to an end on Jan. 1, 1948: 2,144,022 persons out of a pop. of 22 million had been screened; 347,667 removed from their posts, another 572,195 had been placed in categories (3) and (4); proceedings were continuing only against "major" Nazis. In the U.S. zone, proceedings against Germans born since Jan. 1, 1919, except members of the criminal organizations, were suspended, May 3, 1947, at which date 3,330,557 Germans had been examined, and 251,845 had been sentenced; in Oct., some 250,000 cases still remained to be tried, but it was expected that denazification in the U.S. zone would be completed in the spring of 1948. In the Russian zone, the denazification tribunals were dissolved on April 10, their work completed.

After their acquittal by the international court at Nuremberg, Fritzsche, Papen, and Schacht were re-arrested and sentenced as major Nazi offenders, the first two by

a German denazification court (*Spruchkammer*) at Nuremberg to 9 and 8 years respectively in a labour camp; the third at Stuttgart to 8 years.

**NAZRANA OR NAZAR.** Term commonly used in India for a ceremonial present, especially one given by an inferior to a superior. The word properly means a vow or votive offering, and the root may be seen in the name of the Hebrew devotees, the Nazarites. Other forms of the word are nuzzerand and nuzzzer.

**Neagh.** Lough or lake of N. Ireland. In the prov. of Ulster, it is bordered by the counties of Antrim, Londonderry, Tyrone, Armagh, and Down. It is the most extensive sheet of fresh water in the United Kingdom, and measures 18 m. in length and 10 m. in breadth; its greatest depth is 102 ft. Numerous rivers feed the lake, the largest of which are the Blackwater and the Upper Bann, while the Lower Bann discharges its surplus waters into the Atlantic Ocean. There is canal communication between the lough and Belfast, Newry, and Lough Erne. *Pron.* Nay.

**Neagle, ANNA** (b. 1904). British screen and stage actress. Marjorie Robertson, sister of the singer

Anna Neagle,  
British actress

Stuart Robertson, was born in London, Oct. 20, 1904, and first appeared on the stage in 1925. After playing in revue, she entered films in 1930 and achieved success by her interpretations of famous characters, e.g. Nell Gwynn and Peg of Old Drury, Queen Victoria in *Sixty Glorious Years* and Victoria the Great, Edith Cavell in a film of the same name, and Amy Johnson in *They Flew Alone*. Later films included *Piccadilly Incident*, *The Courtneys of Curzon Street*, and *Spring in Park Lane*, 1948. She reappeared on the stage as Rosalind in *As You Like It*, Open Air Theatre, Regent's Park, 1934, and, in 1944, as Emma in a dramatization of Jane Austen's novel. She married the film director Herbert Wilcox in 1943.

**Neale, EDWARD VANSITTART** (1810-92). British cooperator. Born at Bath, April 2, 1810, he graduated at Oriel, Oxford, in 1827, and was called to the bar in 1837. He used his wealth in opening the first cooperative store in London. In 1851

he founded the Central Cooperative Agency, which failed, but was the forerunner of the Cooperative Wholesale Society. He organized cooperative societies in other parts of the kingdom, and in 1869 promoted the annual cooperative congress, of which he became secretary, during 1875-91, visiting America in the former year. He joined the Christian Social Union shortly before his death, Sept. 16, 1892. *See* Cooperation.

**Neale, JOHN MASON** (1818-66). Anglican divine and poet. He was born in London, Jan. 24, 1818,

John Mason Neale,  
American divine

studied at Trinity, Cambridge, was ordained in 1841, and in 1846 became Warden of Sackville College, an almshouse at East Grinstead, where he remained until his death. He was a leader of the High Church movement, and was inhibited for 14 years by his bishop. Neale was one of the greatest British hymnologists, composing original hymns and translating many from the Greek and Latin. Among his translations the most popular is Jerusalem the Golden, a part of the Rhythm of Bernard of Morlaix. He published Hymns for Little Children, 1842, and Hymns for the Young, 1844. Neale died Aug. 6, 1866. *See* Hymns. *Consult* Life, E. A. Towle, 1907.

**Neander, JOHANN AUGUST WILHELM** (1789-1850). German historian. He was born at Göttingen,

Jan. 17, 1789, the son of a Jew, named Mendel. On baptism he changed his name to that by which he is known (Gr. new man), and went to study divinity at Halle, under Schleiermacher, whose writings had brought about his conversion. He became professor of theology at Heidelberg, 1812, and from 1813 until his death was professor of church history at Berlin. Many of his works were translated into English. He died July 14, 1850.

**Neanderthal Man.** Palaeolithic race inhabiting Europe during the Mousterian period, named after the Neanderthal ravine near

Düsseldorf where the first human remains of the type were discovered in 1856. Its fossil relics, associated with flaked flint implements, have since been found in widely-scattered cave sites in Europe, Malta, and Palestine. Neanderthal man is not an ancestor of *Homo Sapiens*. *See* Man; Mousterian.

**Neapolis** (Gr., new town). Ancient seaport in Macedonia, near the modern town of Kavala. It was here that S. Paul landed during his second missionary journey, with Silas and Timothy (Acts 16).

**Neap Tides.** Those tides which reach the lowest high-water mark, the highest tides being called spring tides. Neap tides are those immediately following the first and third quarters of the moon, and their range is usually only one-third of the spring tides. *See* Tides.

**Nearchus.** Greek navigator. Born in Crete, he removed to Amphipolis in Macedonia, where he began a lifelong friendship with Alexander, whom he accompanied on his Indian campaign, 327 B.C. Appointed commander of the fleet built by Alexander on the Hydaspes, he undertook to conduct it from the mouth of the Indus along the coast to the mouth of the Euphrates. A further journey round the African and Arabian coasts was abandoned owing to Alexander's death. Nearchus was allowed by Antigonus to retain the provinces of Lycia and Pamphylia, which had been bestowed upon him by Alexander, but nothing further is positively known of him. A summary of his *Paraplois* (coasting voyage) is given in Arrian's *Indica*.

**Near East.** Term loosely applied, generally in a political rather than a geographical sense, to describe Egypt, Palestine, Turkey, and Syria. *See* Far East; Middle East.

**Neasden.** District of Middlesex, England, in the borough of Willesden. Neasden is a station on the Metropolitan and Bakerloo lines. The parish church is dedicated to S. Catherine, and is a modern building. Neasden lies on the North Circular Road. It has some industrial development, but is mainly residential.

**Neath.** Mun. borough, market town, and river port of Glamorgan-shire, Wales. It stands near the mouth of the river Neath, 8 m. from Swansea and 183 m. by rly. from London, on two canals; it is on the site of the Roman fort of Nidum (discovered 1949). The buildings include the restored church of S.

Thomas, the modern one of S. David, the town hall and market house. The site of Gwyn Hall, dating from 1888, was a gift to the town.

The town of Neath lies in a profitable mining district, and the industries include tin-plate works, steel works, foundries, engineering works, etc. In the 12th century an abbey and castle were founded at Neath, and there are remains of both. The town became a borough about the same time and was long under the lords of Glamorgan, who allowed the citizens to hold an annual fair. Market days, Wed. and Sat. Pop. 33,340.

**Neat's Foot Oil.** Lubricant for fine machinery, also used in dressing leather. It is obtained from boiling the hoofs of cattle, for which neat is an old term, and has the advantage of not easily solidifying or becoming rancid.

**Nebo.** God of the ancient Babylonians. The son and interpreter of Merodach, he was regarded as the writer of the first book and instructor of mankind in letters and science. There was a temple to him at Borsippa or Birs-Nimrud. *See* Babylonia.

**Nebraska.** Tributary of the Missouri river, better known as the river Platte (*q.v.*).

**Nebraska.** N. central state of the U.S.A. Its area is 76,653 sq. m. The surface is an elevated plain sloping to a high point of 5,340 ft. in the foothills of the Rockies in the W. to a low point of 825 ft. in the area approaching the Missouri. In the N.W. are the arid "bad lands." The principal river systems, the Platte (with a total length of 1,600 m.), the Niobrara, the Big Blue, and the Republican, flow through the state to the Missouri, the natural boundary on the E. The inland climate is dry and healthful, and the rainfall scanty (annual average 27.7 in., 46 p.c. during May, June, and July). The state has, however, become a great agricultural centre, mainly as a result of extensive irrigation schemes, covering over a million acres. Maize is the crop for which Nebraska is best known, though rye, wild hay, winter wheat, sugar beet, oats, barley, potatoes, and a variety of fruits are also grown. The state is also an important centre for the raising of cattle and the production of dairy products, Omaha, the largest city, being the greatest butter-manufacturing city in the world.

In the N.W. section fossil deposits have been found, proving the existence of man there from

J. A. W. Neander,  
German historian

10,000 to 12,000 years ago, and the skeletons of the sabre-toothed tiger, the dinosaurs, and other extinct animals were also unearthed.

The state is almost entirely rural, there being only two municipalities with a pop. of more than 20,000—Lincoln, the capital, and Omaha, the industrial centre. Five rly. systems traverse the state, with over 6,200 m. of track, and the Union-Pacific rly. has its headquarters in Omaha.

Higher education is provided by a state university at Lincoln, and there are also an affiliated college of agriculture and four state colleges for teachers. Two senators and four representatives are sent to congress. In 1934 the state voted for a unicameral legislature, sitting at the Capitol at Lincoln, the 400-ft. central tower of which, surmounted by a 20-ft. statue of a sower, is a remarkable piece of architecture, built in 1934. In its early history Nebraska was the scene of many battles with the Indians, including the last fought on American soil, 1873. It was admitted to the union in 1867. Pop. 1,315,834. Nebraska city (pop. 7,339), once a flourishing river port, contains John Brown's cave, a haven for runaway slaves on the "underground rly." from the S. *Consult* Nebraska, Old and New, A. E. Sheldon, 1937.

**Nebuchadrezzar** OR NEBUCHADNEZZAR. Name of three kings of Babylon. The most famous, Nebuchadrezzar II, son of Nabopolassar, reigned 604–561 B.C., invaded Judah thrice, taking Jerusalem and carrying many Jews into captivity, 586; captured Tyre, after a siege of 12 years, and invaded Egypt. He restored many temples and rebuilt Babylon, where Koldewey's excavations, 1899–1911, revealed his palace, temples, gates, walls, quays, and canals. The spelling Nebuchadrezzar is that used in the A.V., but Nebuchadrezzar is preferred by modern authorities. *See* Babylon, col. plate; Borsippa; Carchemish; Daniel; Ziggurat.

**Nebula** (Lat., mist). In astronomy, any celestial object not a comet having a diffuse appearance in the telescope. So many quite distinct objects of totally different structure fit this description that the modern tendency is to drop the word altogether and use a more precise terminology for the various star-clusters, galaxies, and interstellar clouds hitherto classed as nebulae. Only a few nebulae are bright enough to be seen with the naked eye as faint hazy patches of

light, but millions can be photographed with the aid of modern equipment.

The first catalogue of nebulae by Messier in 1784 was made to enable these objects to be quickly distinguished from comets. Like Messier's, the Herschels' catalogue of 5 000 nebulae included many objects subsequently found to be star-clusters. Dreyer's New General Catalogue (1887) with its supplements (1894, 1908) contains 13,226 objects, nearly all of which are true nebulae.

#### Two Main Classes

Present knowledge enables us to divide the nebulae into two main classes: galactic and extragalactic. Galactic nebulae are concentrated to the Milky Way and are therefore part of our own galactic system like the stars. They are clouds of gas and dust lying at distances comparable with stellar distances. Extragalactic nebulae avoid the neighbourhood of the Milky Way merely because local absorption in the plane of the galactic system obscures their light in that direction. They are assemblies, like our own galaxy, of hundreds of millions of stars at distances far exceeding stellar distances: they have been aptly named "island universes." The nearer ones themselves contain objects resembling galactic nebulae.

**GALACTIC NEBULAE.** These fall into three classes. The *dark nebulae* in the Milky Way are detectable only by their obscuring effect on the light of more distant stars. An example conspicuous to the naked eye is the "Coal Sack" near the Southern Cross. They lie at distances up to about 1,000 light years; beyond this they doubtless exist but are difficult to detect owing to the presence of foreground stars. There is little doubt that they consist of a mixture of dust particles and interstellar gas. The *diffuse* or *gaseous nebulae* are irregular patches of luminosity usually (perhaps always) associated with bright stars, for example the Orion nebula. They are not self-luminous but shine by reflection or fluorescence, the energy being derived from the light of stars embedded in them. Their spectra may be continuous or may consist (*see* Nebulium) of bright lines, according as the associated star is at a moderate or very high temperature. It is likely that the diffuse nebulae are not essentially different from dark nebulae, being just those parts of the latter which are lighted up by near-by stars. The *planetary nebulae*, of which

only about 150 are known, appear as round or oval patches of light, usually with a faint star at the centre. Their spectra show the bright lines appearing in some diffuse nebulae. They probably consist of extremely hot stars which have thrown off shells of gas that shine by fluorescence.

**EXTRAGALACTIC NEBULAE.** These can be classified into three types. The *elliptical nebulae* range from spheroidal to spindle-shaped objects, none of which could be resolved into stars until 1943. Their spectra, however, show that they are composed of stars, even if their distances are too great for individual stars to be distinguished. The *spiral nebulae* (*see* Andromeda Nebula) are more easily resolved, especially those with "open" arms. It is highly probable that our own galactic system would resemble a typical spiral nebula if we could see it from outside. The *irregular nebulae* show no common geometrical form but also consist of millions of stars. The Magellanic Clouds (*q.v.*) are the nearest of these to us. Spectrograms of the extragalactic nebulae show displacements of the spectral lines towards the red which are interpreted as due to an expansion of the universe similar to that predicted by certain forms of the theory of relativity (*q.v.*). *See* Astronomy; Galaxy; Stars.

A. Hunter, Ph.D., F.R.A.S.

**Nebular Hypothesis.** In astronomy, a theory to account for the origin of the planetary system. First suggested by Immanuel Kant, in 1755, and placed on a more definite basis by Laplace, the latter supposed that the matter which now forms the sun, planets, and satellites existed once in the state of gas, and that this gaseous mass formed a vast globe which extended from the sun's present position as a centre out to, or beyond, the orbit of Neptune, and that this gaseous mass was rotating. As it rotated it gradually flattened in shape, its particles were consolidated, and its speed of rotation was increased.

Under the action of increasing speed of rotation and flattening, some of the gaseous matter would be detached from the central mass in the form of a ring. This ring would break up into separate globular masses which would ultimately coalesce in the largest of them and thus form the first, and outermost, planet, and this process would be repeated, to give rise, in turn, to the other planets. *See* Planet.

**Nebulé.** In heraldry, a line of division, or outline of a charge, forming a series of rounded projections, pointing to each side to represent clouds.

Nebulé in heraldry

### Nebulium.

Former name of gas responsible for the two bright green lines in the spectra of many gaseous nebulae. In 1927 Bowen identified the lines theoretically as radiations to be expected from doubly-ionized oxygen exposed to high-temperature low-pressure radiation. These conditions cannot be produced in the laboratory.

**Necessity.** Constraint or compulsion regarded as a law which makes anything what it is and excludes its being anything else. Logical necessity is the impossibility of conceiving a thing different from what, according to the laws of thought, we conceive it to be; here belongs the principle of identity.  $A=A$ . Physical necessity is the certainty that a particular cause in similar conditions will always be followed by a particular effect. See Determinism; Kant.

**Necho OR Nechoh.** King of Egypt (610-594 B.C.). The Egyptian Nekau, he succeeded his father Psammetichus I, founder of the XXVIth dynasty. The Assyrian power having fallen, he reconquered Syria, defeating and slaying Josiah of Judah at Megiddo, 609 B.C. He reached the Euphrates and on his return march deposed Jehoa-haz, son of Josiah, replaced him by his brother Eliakim whom he called Jehoiakim, and exacted a heavy tribute from Judah. Nabopolassar, king of Babylon, sent his son Nebuchadrezzar to Syria, with the result that Necho was defeated at Carchemish 605 B.C. and lost the whole of his conquests in Syria and Palestine (2 Kings 23; 2 Chron. 35, 36; Jer. 46). Phoenician seamen sent by Necho are said to have circumnavigated Africa. See Egypt.

**Neck.** Part of the body which unites the head with the trunk. The neck supports the head by means of the cervical vertebrae. In front of the bony pillar lies the oesophagus, terminating above in the pharynx, and in front of these are the trachea and larynx. The thyroid gland is situated in the lower part of the neck, a lobe being on each side of the trachea with an isthmus connecting them across the middle line. The carotid arteries pass up from the thorax to the head at the side of the neck, and

Neck. Sectional view from the side, showing principal veins and nerves

can be felt pulsating close to the anterior margin of the sternomastoid muscle. The jugular veins pass downwards close to the carotid arteries. Close to these structures are the vagus and other nerves passing between the head and the trunk.

The most prominent muscles of the neck are the sterno-cleido-mastoids, one on each side, which run from the breast-bone and inner end of the collar-bone to the mastoid process, a bony prominence just behind the ear; and the trapezii, which pass up from the back and are inserted into the occipital bone at the lower part of the back of the head. See Anatomy; Fibrositis; Hanging; Man; Strangulation; Trachea.

**Neckar.** River of S. Germany, a tributary of the Rhine on the right bank. Rising near the Danube, between the Black Forest and the Swabian Jura, it flows N.E. and N. through Württemberg-Baden, and turns W. at Eberbach to join the Rhine at Mannheim. Its length is about 250 m., and its chief tributaries on the right bank are the Fils, Rems, Kocher, and Jagst, and on the left the Ens. The chief towns on the Neckar are Tübingen, Cannstatt (a suburb of Stuttgart), Heilbronn, Heidelberg, and Mannheim. Though very rapid, the river is navigable for small vessels as far as Cannstatt. See Mannheim.

**Necker, JACQUES (1732-1804).** French financier and statesman.

Born at Geneva, of Pomeranian extraction, Sept. 30, 1732, he entered the Vernet Bank at Paris about 1747, and in 1762 founded a successful bank of his own. Director of the treasury, 1776, he was

Jacques Necker, French financier

made director-general of finance in 1777. He published his *Compte Rendu*, 1781, and then retired, his treatise on French financial administration following in 1784. Exiled from Paris, 1787, he was recalled as director-general in 1788, and was responsible for summoning the states-general and doubling the representation of the third estate. Dismissed on July 11, 1789, he was recalled a few days after the fall of the Bastille. He held office until Sept., 1790, when he retired to Coppet, Switzerland, where he died on April 9, 1804. See *Vie privée de M. Necker, Madame de Staël*, 1804.

**Necker, SUZANNE CURCHOD (1739-94).** French writer. Born at Crassier, canton of Vaud, Switzerland,

Suzanne Necker, French writer

daughter of a Protestant pastor, she was for some time in love with Edward Gibbon before marrying Jacques Necker in 1764. Her salon was one of the most celebrated in Paris, frequented by such men as Diderot, Buffon, André Morellet, and Marmontel. Famed also for her charities, she founded, 1778, and for some years administered, the Hôpital Necker in Paris. She died at Coppet, Switzerland, in May, 1794. Her daughter, Anne Louise Germaine, became Madame de Staël (q.v.). See *Le Salon de Mme. Necker*, G. d'Haussonville, Eng. trans. 1882.

**Necklace.** Ornament for the neck worn by most races from the remotest times. They are usually collars of metal in the form of solid rings, gorgets, open work or filigree, textiles, or of chains, often ornamented with pendants and decorated with enamels, glass, and precious stones. The torque, worn by prominent men among the Gauls, Persians, and other ancient nations, was a rigid necklace or collar of spirally twisted gold. See Anglo-Saxon Antiquities; Assyria; Celt, colour plate; Jewelry.

**Necromancy** (Greek, *nekros*, corpse; *manteia*, divination). Divination by pretended communication with the dead. The art is usually exercised by professional sorcerers, as in the familiar example of the witch of Endor, in 1 Sam. 28, who professed to evoke the spirit of the prophet Samuel at the behest of Saul. In Homer's *Odyssey*, bk. 11, the conversation of Ulysses with Theresias in Hades differs from regular necromancy in

that the shade of the departed seer was not brought back to earth. When Cortès invaded Mexico it is recorded that the spirit of Montezuma's sister Papantzin was evoked, and foretold the downfall of the Aztec empire.

Necromancy still prevails widely in primitive culture. The Zulu witch-doctor causes the voice of his *amatongo* to be heard by means of ventriloquism; in W. Africa the Ewe medicine-man in cases of sickness elicits the future course of the disease by consulting his *tro*; the Melanesian *tindalo*, or ghost, is evoked for advice such as whether a proposed canoe voyage may be safely undertaken.

In medieval Europe the word was corrupted to nigromancy, as if from Lat. *niger*, black, and in that form came to denote the black art, or witchcraft in general. See Divination; Magic.

**Necropolis** (Gr. *nekros*, corpse; *polis*, city). Word meaning a city of the dead. It was anciently applied to an outlying part of Alexandria which was set apart for burial purposes, and is used in connexion with modern cemeteries, such as those at Woking in Surrey and at Glasgow. The burial ground at Woking is served by a rly. station called Necropolis.

**Necropsy**. In medicine, name given to the examination of the body after death. See Autopsy; Post Mortem.

**Necrosis**. In pathology, the death of a limited portion of tissue. Most commonly the destruction of periosteum, or covering of the bone through which the blood-vessels enter, leads to necrosis of the bone. Generally necrosis is caused by failure of nutrition of any tissues. See Gangrene.

**Nectar**. In Greek mythology, the drink of the gods, their food being ambrosia. It was supposed to confer immortality on those who drank it, and on that account was forbidden to mortals.

**Nectaries**. Glandular structures occurring in plants which secrete nectar. This juice, in which fructose, glucose, and sucrose are commonly present, escapes through the epidermis of such nectaries as that of the buttercup. Stomata are present in the surfaces of other plants, e.g. Umbelliferae. At first syrupy, nectar becomes diluted by absorbing water from the underlying tissues. Nectaries are usually so situated that insects seeking nectar must make contact with stamen and stigma. In Umbelli-

ferae they form an exposed cushion above the ovary between the stigmas and the insertion of the stamen. More often they occur deeper in the flower. In the Cruciferae they are on the receptacle at the bases of the stamen; in the Rosaceae, frequently within the hollow receptacle. Any part of the flower may be concerned. *Caltha* forms nectar low down on the sides of its carpels; *Viola* has on two of its stamens appendages which secrete nectar into a surrounding corolla spur. Such containers may prevent the nectar being washed away by rain. Pockets at the bases of buttercup petals secrete nectar, while in larkspur and monkshood the tubular petal nectaries have little other function. Extrafloral nectaries occur on parts of the plant other than the flower, e.g. on cherry leaf stalks. On bracken fern nectaries are found in the forks of its fronds.

**Nectarine**. Edible fruit, a smooth-skinned variety of the peach (*q.v.*). The methods of cultivation and habit of both nectarine and peach are generally identical, but the fruit of the nectarine has a richer flavour, and is more tender of skin than the peach, and therefore must not be touched by hand during development, or the ripened fruit will be bruised and spoiled.

Nectarine. Branch with foliage and ripe fruit

**Nederl and Line**. Dutch steamship company. Running the principal transport services between Holland and the Netherlands East Indies, it maintains frequent sailings from Amsterdam and Southampton to Singapore, Java, and other East Indian ports. Much of the fleet was lost in the Second Great War while carrying troops or cargo.

**Neditch, MILAN** (1881-1946). Yugoslav soldier. After service in the Balkan and First Great Wars, he rose to command a division in 1936 and was war minister in 1940. When Croatia broke away from Yugoslavia in 1941, the Germans made him premier of the puppet state that remained. He fled to Italy in 1945, but was captured by U.S. troops and handed over to Yugoslav authorities. It was announced that he had committed

suicide while awaiting trial some time before Feb. 6, 1946.

**Needham, JOSEPH** (b. 1900). British biochemist. From Oundle school he took a Benn Levy studentship in biochemistry, and lectured at Stanford, Yale, Cornell, Oxford, and Polish universities. From 1933 he was Dunn reader in bio-chemistry at Cambridge. F.R.S. in 1941, he led in 1942 the British scientific mission in China, and in 1946 became head of the division of natural sciences, UNESCO. Needham wrote *Man a Machine*, 1927; *The Skeptical Biologist*, 1929; *Chemical Embryology*, 1931; *History of Embryology*, 1935; and *Chinese Science*, 1946. His wife, Dorothy May (born Moyle, 1896), also a biochemist, was elected F.R.S. 1948.

**Needle**. Instrument used for carrying a thread in sewing or similar operations, consisting of a thin, pointed rod of steel, bone, or other material. Sewing-machine needles have an eye at the point; other sewing needles have an eye at the opposite end. Sewing needles are defined according to their construction, use, or function, as drill-eyed, golden-eyed, sharp, blunt, carpet needle, etc. The word is also used for a thin, straight rod of bone, wood, or metal used in knitting; for a light, hooked rod used in crochet; and for a thin, flat piece of metal,

or a light metal rod pivoted at a point along its length, as in a magnetic compass, telegraphic instruments, and apparatus for measuring electric currents. Surgeons' needles for stitching wounds are curved, upholstery needles are double-pointed, sack needles have a square section, etc. See Bone Implements.

**Needle-Gun**. First successful breech-loading rifle for military use. The weapon was invented

Needle-Gun. The first successful breech-loading rifle

by a Thuringian mechanic, J. N. Dreyse, in 1839, and quantities were being manufactured by 1841, as the rifle was adopted by the

1. Nebulae, whence the stars are formed, are vast, tenuous clouds of luminous gas scattered through space. In their earliest stages, shown by the lower of the two above, they are diffuse and often almost globular

2. These nebulae revolve slowly, but as they shrink under the force of gravity their rotary speed increases. They become flattened at the poles (as seen in Fig. 1) and begin to bulge out round the equator

3. After a certain stage the equatorial "bulge" can go no further and still maintain equilibrium. Matter is then thrown off by centrifugal force, and can be seen as a dark band across the nebula above

4. With further contraction and still faster rotation the ejected matter may form a complete ring. Such is the size of these nebulae that one complete revolution may take millions of years

6. This would look much like the preceding nebula if observed "edge-on." Note that the matter of the rings tends to condense into clots, as is also shown by the second nebula in Fig. 1

7. Perfect rings are, however, rare. More usually the gaseous matter is thrown off from opposite points of the equator only, forming two spiral arms by reason of the nebula's rotary motion

5. A fully developed nebula is shown in the photograph above. Here the nucleus has shrunk so much that the thrown-off matter surrounding it now constitutes most of the visible bulk of the object

8. The clots are nascent stars, or groups of stars, and from them by cosmic accidents planets such as the Earth may be detached; but even the preliminary stages shown in this series have occupied many millions of years

See text, p. 5933

NEBULAE, SHOWING IN SUCCESSIVE STAGES OF DEVELOPMENT THE REMOTEST ORIGIN OF SUNS AND PLANETS.

From photographs taken at Mount Wilson Observatory, California

The fact that A acts without proper care and thereby B is injured will not entitle B to recover damages from A unless A owes B a duty to take care. A famous statement of the limits of the duty to take care was given in the house of lords in 1932: "You must take reasonable care to avoid acts or omissions which you can reasonably foresee would be likely to injure your neighbour. Who then in law is my neighbour? The answer seems to be: persons who are so closely and directly affected by my act that I ought reasonably to have them in contemplation as being so affected when I am directing my mind to the acts or omissions which are called in question."

An example will illustrate the limits of the duty. Y drives his car so negligently that X is killed. A hears the collision and sees the consequences of it and receives such a shock that she is prematurely delivered of a child of which she was pregnant, the child being stillborn. She cannot recover damages from Y because Y owed her no duty. His duty to take care on the highway is limited to persons so placed that it is reasonable to expect they may be injured by his lack of care.

Until the Law Reform (Contributory Negligence) Act, 1945, where a person was injured by the negligence of another he could recover nothing if he himself had even in the smallest degree also caused the injury by his own contributory negligence. By that Act, however, such a person is entitled to recover, but the amount of damages is reduced proportionally to his share in the responsibility for the injury.

**Negoi** or **NEGOTU**. Highest mt. in Transylvania, Rumania. Its alt. is 8,320 ft. It is a peak in the central section of the Transylvanian Alps, and rises E. of the Rotenturm Pass.

**Negombo**. Coast town of Ceylon. It is on the W. coast, 23 m. N. of Colombo, with which it is connected by the coast rly. and canal. It stands in a fertile area planted with coconut palms. There is a fishing industry, and a trade in cinnamon. The Dutch House dating from 1682 is a notable building. Pop. 25,291.

**Negotiable Instrument**. In English law, a document by delivery of which the legal right to the property which it secures may be conveyed. The distinction is between negotiability and assignability. All contracts, except for

personal services and the like, and all property, can be assigned or transferred, but the person who receives them takes no better title than the assignor had; and, further, takes subject to equities and rights as between the transferor and the debtor.

If A draws a bill of exchange, which is a negotiable instrument, in favour of B, and B negotiates it to C, C can sue A for the full amount of the bill, without regard to any claim which A may have against B. Again, if a negotiable instrument is lost or stolen, and is negotiated to A, who takes it in good faith and for value, A has a good title to it. Instruments are negotiable by the custom of merchants, and any instrument may be made negotiable by universal usage. Bills of exchange, promissory notes, and cheques are the most usual negotiable instruments; but bonds to bearer, dividend coupons, bills of lading, dock warrants, wharfingers' certificates, have by statute and custom acquired most of the incidents of negotiability. See Bill of Exchange.

**Negretti**, ENRICO ANGELO LUDOVICO (1817-79). Anglo-Italian optician. A native of Como, he settled in London in 1829, became a glass-blower, and began business as a maker of thermometers in 1843. With his partner, Joseph Warren Zambra (q.v.), he gained a high reputation for optical and scientific instruments at the great exhibition of 1851, thus founding a business which acquired worldwide celebrity. An ardent Italian patriot, Negretti helped the many refugees in England, and extended hospitality to Garibaldi both in his dark days and during the time of his prosperity. He was naturalised in 1862, and died at Cricklewood, Sept. 24, 1879.

**Negri**, ADA (b. 1870). Italian poet. She was born in humble circumstances at Lodi, Lombardy, Feb. 3, 1870, and having become a teacher, won immediate fame by the publication of a volume of poems, *Fatalità*, 1893. After its publication she taught in the normal school at Milan, and was married to a manufacturer named Garlanda. Other volumes of her poems were *Tempeste*, 1896, and *Maternità*, 1904. In 1917 she published *Le Solitarie*, which was a collection of short stories of the loneliness of women.

**Negrin**, JUAN (b. 1889). Spanish scientist and politician. A distinguished physiologist, he was professor at the medical faculty of

Madrid university, and director of the Spanish Physiological Institute. In politics he was a moderate Socialist, and was minister of finance in the cabinet of Largo Caballero, 1936-37. On Caballero's resignation he became premier, May 15, 1937, retaining the finance portfolio and assuming that of national defence, April, 1938. In Nov., 1938, he transferred the government of Spain to Barcelona; and on the final victory of Gen. Franco he fled to France, Mar., 1939, and went to Mexico, 1940. He retained the premiership of the Spanish shadow government until Aug., 1945, when he placed his resignation in the hands of Diego Martínez Barrio, who had been chosen as president-elect by the exiled Spanish Socialists.

**Negri Sembilan**. Territory of Malaya, alternatively called Nigri Sembilan (q.v.).

**Negrito** or **NEGRILLO**. Diminutive form of Negro, used of many peoples of very small stature. The first term is in general use in S.E. Asia, the second in tropical Africa. The Andamanese males average 58.5 ins. in height, have black curly hair, sometimes with a reddish tinge, bronze to black skin, broad head (breadth 83 p.c. of length), broad face, lips full but not everted, and non-projecting jaws. The Semang of Malaya are similar, but with longer heads (breadth 79 p.c. of length), and so, within close limits, are the Aeta of the Philippines and the Tapiro of New Guinea, though the last-named have much lighter skins. Some of the same characteristics may be traced among populations in India, S.E. Asia, Indonesia, and Melanesia, and appear to be heritages from ancient elements in the population of inter-tropical regions of the Old World. The survivors linger on mainly in warm, wet forest regions.

Akka, Batwa, Bambute, Ituri, and Wochua of the Belgian Congo, Babongo of French Equatorial Africa, and a few other groups in the Cameroons average from 53.5 to 55.5 ins. in height, with trunk and legs short and arms relatively long, hair often in "peppercorn" curls, dark rusty in colour, skin often yellowish-brown, but sometimes very dark, nose broad and eyes protuberant. The relation of breadth to length of head varies considerably within these groups. They are for the most part jungle-hunters and collectors, using snares and poisoned arrows. The Bushmen of S. Africa may not be closely related to the Negrillos.

## THE NEGRO AND HIS CHARACTERISTICS

H. J. Fleure, F.R.S., President, Royal Anthropological Institute

*The physical features, customs, and distribution of the Negro in his land of origin, Africa, are here described. Some account of his position in the Americas follows*

Dark skin and black kinky hair are general features of the indigenous peoples of Africa S. of the Sahara and Abyssinia, whence the name Negro (Lat. *niger*, black). These features also occur among some peoples of Malaya, the Andaman Is., Indonesia, Papua, and Melanesia, who are sometimes called Oceanic negroes. Dark skin in Africa is due to melanin grains in the skin, a pigment valuable in stopping excessive short wave radiation (violet and ultra-violet rays) from penetrating the skin and causing blisters, etc. The tropic of Cancer runs through the Sahara, and a few degrees S. of this, near the Senegal river, in N. Nigeria, near Lake Chad, and in the Sudan there live the darkest skinned Africans, matched only, elsewhere, in Angola, a very dry area on the tropic of Capricorn.

Among the rain forests of W. Africa and the Congo, cloud and rain limit ultra-violet rays for a good part of the time, but the intense, moist heat is trying. Sweat glands and skin blood vessels are numerous and large, promoting evaporation when it becomes possible. The large sebaceous glands keep the skin supple. Pores of sweat glands and of hairs are large and loose, promoting evaporation, and the looseness of hair pores makes hair growth so irregular that the hair on exposure bends irregularly, *i.e.* is kinky. Everted lips and broadly open nostrils further promote evaporation. Blood colouring combines with the dark melanin grains, and together they often give a chocolate brown tint. E. Africans vary, as is to be expected along a main line of migration, but rarely show the great development of skin blood vessels. In S. Africa a more golden brown is common.

### Colour of Skin

Skin-darkening is one of a group of specialisations among peoples spreading S. from the Saharan region, a response to environmental conditions. Such specialisations are typically irreversible, so that the dark skin does not become white in a cool climate, nor white skin dark in a dry, hot one. Both are specialisations from an original, probably not very dark, brown. Drifts of hunter-collectors of the Old Stone Age can be traced archaeologically from the W. Sahara

and the Nile southward through E. Africa, and this mode of life still persists among pigmies of the equatorial forest and bushmen of the arid S.W. Both have yellow-brown grey skin and are short, pigmies much shorter than bushmen. They live in small groups with little distinction of rank, and the groups are said to fluctuate with the luck in hunting. Some bushmen have become hangers-on around European settlements. Among hunter-collectors able-bodied men hunt, while women, old men, and children collect.

### Crops and Customs

Cultivation spread through Africa from the Nile valley, but only with difficulty and limitations. Millets were tolerant and adaptable, and have become the traditional food plants, but wheat and barley would not respond to native African methods. A few poor varieties of beans and yams may have been native, and the banana is an ancient introduction into the hot, wet regions, probably from Asia. Grasses grow rank and coarse, poor in vitamin C and phosphates, and farm animals are correspondingly poor in quality, as well as subject to attacks of many parasites, among which tsetse and ticks are widespread, especially in regions where the climate is wet. Milk supply is correspondingly poor, and the cattle are not used for ploughing save under the leadership of recent immigrants (some Islamic peoples in Nigeria, Europeans elsewhere). Farming is therefore of low grade, and care of the soil is almost unknown.

Individual or family property in land is unknown in purely native modes of living; the land belongs to the group, a heritage from ancestors to be passed on down the generations. The group's claim to land may be emphasised by burials on the limits of the area claimed. The spirits of ancestors therefore enter into African belief and ceremonial life. Spiritual power is also believed to reside in certain objects called fetishes, and in persons whom Europeans call witch-doctors who may or may not be connected with the custody and care of the fetish. Crude analogies promote hopes and fears attended by fanciful practices that make up the ceremonial life of the African peoples, as of all others.

The witch-doctor or a war-leader may be considered a chief of a village or of a mobile group of herdsmen, or, especially in the N., of a group of villages, and, under influence of Islamic and other outside elements, the chief may be magnified into a king with supernatural powers, and with the custody of the land of the group and the granting of the right-of-user in that land to the families concerned. The king may himself be subject to ritual restrictions, usually fancies gathering around the central idea of maintaining the spiritual power of the king.

Especially in W. Africa, where many conqueror-groups rule over lowlier folk, secret societies are a great feature and may have much influence. Elders of the village may form a council and daughter villages may remain in association with the mother settlement and in this way grade into states or kingdoms such as Dahomey and Ashanti in the W., the Congo in Central Africa, and Uganda in the E. Leaders of herder groups have at times founded empires of short duration, Chaka in S. Africa being the best known of such leaders.

The pop. of Africa is the mixed result of many drifts from the N., with survivals of the older drifts in the hot, wet forest and the arid S.W. It is usually moderately long-headed, and broad heads are rare save among some forest pigmies whose heads are relatively broad because they are so short. But there are marked contrasts. The forest negro, especially in the W., is long armed and short legged, the men of Sudan have extremely long, thin legs. The drifts into negro Africa from the Old Stone Age onwards show a gap in the sequence, and negro Africa seems to have had no Bronze Age. Iron working spread in a crude fashion, often with stranger- or wandering-smiths. The spread of Islam in N. Africa seems to have brought pressure on negro Africa.

After the discovery of America the introduction of maize, manioc, and other food plants would have permitted a rise in standards of living but for the disorganization which followed the vast increase of the slave-trade. In the late 19th century European powers forced upon Africans the need to adjust themselves quickly to a commercial world, and in some parts European settlers claimed the best lands for themselves.

The forest man builds timber houses, often close set and rectangular, with a large guard room

or social centre for the men at one or both ends of the house-row. On the grass lands the hut may have a wooden frame with bamboo or other filling, often daubed with clay and provided with a conical roof that may be removed from an old to a new hut. The dry areas may have huts entirely of hardened clay and, in the N., are of sun-dried brick in Nigeria, under Islamic influence. Most equipment is of wood, with axes, etc., of crudely worked iron, gourds for holding water, and some hand-made pots. Iron is more abundant, more elaborately worked in the N. than in the S. A remarkable artistic development flourished in Benin (W. Africa) before and about the time of the coming of Europeans, but not due to their influence; sculpture in wood is a notable feature in W. Africa and the Congo, draughtsmanship among the bushmen.

The forest peoples, with marked similarity of physique, have a multitude of languages; the grass-land peoples, who are very varied physically, nearly all speak a variety of Bantu speech, characterised by the importance attached to prefixes.

Only under Islamic influence or just beyond its region have towns been developed by negroes; the general focus of social life is the village. There is no written language, virtually no priesthood, no beast of burden, roads are poor and few, a coinage has not developed. Music is notable for the fine African voices produced with the help of a high arched palate, and for the syncopated rhythms developed through drumming, which is also a means of communicating news. There are also stringed instruments and pipes or flutes as well as a xylophone with resonators, and a variety of noise-makers or musical contrivances.

#### H. J. Fleure

**THE NEGRO IN AMERICA.** Slavery is responsible for the spread of the negro to the Americas. Imported as a slave in the early days of colonisation to do the heavy field work in the cotton and sugar plantations, the negro remained after the abolition of slavery, a very indigestible section of the community in N. America, more assimilable in S. The total negro pop. of the New World is some 25 million. In 1800 there were a million negroes in the U.S.A. (compared with 4½ million whites); in 1940 there were about 13 million (compared with 120 million whites). In 1940 two-thirds of the negroes of the U.S.A. lived in the S. In Mississippi they were close on 50

p.c. of the pop.; in S. Carolina, c. 44 p.c.; in Georgia, Louisiana, Alabama, Florida, c. a third; in N. Carolina, Virginia, Arkansas, c. a quarter. There were nearly half a million negroes in New York City, some 325,000 of them in Harlem.

The negro became a problem in the U.S.A. only after emancipation in 1863. At the end of the civil war, nearly all educated Southerners were disfranchised, and until the Amnesty Act of 1872 the negro and poor white vote, manipulated by corrupt "carpet-baggers" from the N., decided the government of the S. When the plantation owners regained political power, in seven state legislatures they passed laws imposing an annual poll-tax (not large, but cumulative if forgotten), and in some states a literacy test, which virtually disfranchised the negro.

#### Segregation of the Negro

In the south segregation of the negro in public vehicles, schools, places of amusement, churches, hospitals is enforced; intermarriage between negro and white is prohibited. Yet a large number of persons of mixed blood (who are counted as negroes and constitute probably half the negro pop. of the U.S.A.) are born in the S. of extramarital association between white men and negro women. In the N. legal disability scarcely exists, but even there the negro still tends to be segregated, and to be worse off than his white fellow.

The cotton-growing area where the negro pop. is largest is poverty-stricken and backward; illiteracy, crime, and disease (among poor whites as well as negroes) is considerably higher than elsewhere in the U.S.A. The introduction of machinery into cotton-growing, in particular the mechanical picker (which can pick 30,000 lb. in a 24-hr. day compared with a man's 120 lb. in an 8-hr. day), and the reduction in the amount of cotton grown (acreage decreased from 45 million in 1929 to 20 million in 1944) will, it has been estimated, reduce the demand for labourers in the cotton fields by five million between 1945 and 1955. A change-over to livestock rearing, orchard growing, and general farming is taking place in some of the former cotton lands; but not yet at a sufficient rate to absorb so many displaced workers.

The negro predominates in the pop. of the West Indies, except in Cuba and Puerto Rico. The people of Brazil and the N. coast of S. America also include a marked proportion of negroes. In S.

America, however, there is no colour prejudice, and intermarriage between negro and white or negro and Indian is usual. The negroes of N. America are of Mandingo and allied stocks, those of Brazil chiefly Bantu, their ancestors having been brought from Angola. There has been no appreciable immigration of negroes into the New World since the abolition of the slave trade in 1807. See Liberia. Consult *The American Dilemma*, Gunnar Myrdal, 1944; *Inside U.S.A.*, John Gunther, 1947.

**Negro, Río.** River of S. America, the largest left bank tributary of the Amazon. It rises in Colombia by many headstreams, the chief of which, the Guainia, forms part of the boundary of Venezuela. Flowing generally E.S.E., it unites with the Amazon in Brazil, below Manaos. In parts from 9 m. to 15 m. in width, it is barely 1½ miles wide at its mouth. It contains many islands, and through the Cassiquiare communicates with the Orinoco. Its principal affluents are the Arihaha, Parima or Rio Branco, Uaupés, and Padauri. The total length is about 1,400 m., most of which is navigable.

**Negro, Río.** River of Argentina, on the border of Patagonia. Two Andine streams, the Neuquén and Limay, join to form the main stream, which flows thence 400 m. to the Atlantic Ocean. Rapid and obstructed by shoals and islands, it is of little use for navigation. Its total length is 650 m.

**Negropont.** Variant name for the Greek island of Euboea (*q.v.*).

**Negro Powder.** A permitted explosive for use in coal mines. It consists of 57 p.c. ammonium nitrate, 15 p.c. trinitrotoluene, 27.5 p.c. sodium chloride, and 0.5 p.c. graphite, the maximum permissible charge being 24 oz.

**Negros.** Island of the Philippines. One of the Visayan group, lying between Cebú and Panay, it is 135 m. long, has a mean breadth of 27 m., and covers an area of 4,905 sq. m. It is traversed throughout its length by a well-wooded mountain ridge, which contains the active volcano Canlaón or Malaspina, 8,193 ft. high. Sugar, copra, hemp, tobacco, and rice are largely cultivated, and teak and other timbers are obtained. Fishing is an active industry. Bacólod, on the N.W. coast, and Dumaguete on the S.E. coast, are the principal towns. Pop. est. 500,000.

**Negus.** Title of the emperor of Abyssinia, the full form of which is *negus negusti* (king of kings).

**Negus.** Warm beverage made of port (or sherry) and water, sweetened with sugar and flavoured with lemon, cloves, nutmeg, etc. The water, in the proportion of one-half to two-thirds, should first boil. A small addition of brandy is recommended when the negus is to be drunk cold. Its inventor, Col. Negus, was master of the buckhounds, 1727.

**Nehemiah.** Reputed author of an O.T. book, closely related to the books of Ezra and Chronicles. It records the work in Jerusalem of a Jewish cupbearer of Artaxerxes, who in 444 B.C. was appointed Persian governor of Judah. Nehemiah made two visits to Jerusalem, 445 and 432 B.C., during which he inspected the rebuilding of the walls and introduced various social and religious reforms. The Book of the Law of Moses was read to the people, and they were called upon strictly to observe its regulations. See Bible; Ezra.

**Nehru, JAWAHARLAL** (b. 1889). Indian statesman. Born at Allahabad, India, Nov. 14, 1889, he was educated at Harrow and Trinity College, Cambridge, and was called to the bar at the Inner Temple in 1912. From 1913 he practised as an advocate at the

Pandit Nehru, Indian statesman. See also illus. p. 4474

Allahabad high court, and in 1918 became a member of the all-India congress committee. In 1920 he joined Gandhi's non-violent non-cooperation movement, his activities resulting in his being imprisoned in 1921 and 1922. In 1929 he became gen. sec. and in 1936, 1937, 1946 president, of the all-India congress committee. He was imprisoned for the eighth time in 1940 under the defence of India rules, and again in Aug., 1942. Released in June, 1945, he became vice-president and minister of external affairs in the interim Indian govt., June, 1946. The following Dec., with the viceroy, Lord Wavell, and other Indian leaders, he came to London in a final unavailing effort to persuade the Muslim league to enter the constituent assembly. He was prime minister and minister of external affairs, Commonwealth relations, and scientific research in the first govt. of independent India from Aug., 1947; it fell to him to persuade a London con-

ference of Commonwealth prime ministers in 1949 that, despite her intention to become a republic, India should be allowed to remain within the Commonwealth. Consult *Autobiography*, 1948.

**Neilson, JAMES BEAUMONT** (1792-1865). British inventor. Born June 22, 1792, and employed at a colliery while a boy, he became a foreman and manager of the first Glasgow gasworks. He suggested the use of clay retorts in gas manufacture, sulphate of iron for its purification, and the swallow-tail burner. As a result of studies carried on in his spare time at the Andersonian university, he introduced the hot-blast in iron manufacture, for which he took out a patent in 1828. The process was revolutionary, three times as much iron being obtained for the same expenditure of fuel as by former processes, and in partnership with Charles Macintosh (*q.v.*), Neilson made it a commercial success. He died Jan. 18, 1865.

**Neilson, JULIA** (b. 1869). British actress. Born in London, June 12, 1869, she was educated at Wiesbaden and the R.A.M., making her stage debut in Pygmalion and Galatea at the Lyceum, 1888. She married Fred Terry (*q.v.*) in 1891, and after appearing in many well-known plays, *e.g.* A Man's Shadow, Called Back, An Ideal Husband, The Prisoner of Zenda, and A Dancing Girl, she went into management with her husband in 1900 (a theatrical partnership which continued until 1930) when she scored a great success as Nell Gwyn in Sweet Nell of Old Drury. Another of her famous parts was that of Lady Blakeney in The Scarlet Pimpernel, produced at the New Theatre, Jan. 5, 1905, which she continued to play for many years in the provinces. Other plays in her repertory included Henry of Navarre, The Popinjay, The Marlboroughs. She appeared with Seymour Hicks in Vintage Wine, 1934. Her memoirs, This for Remembrance, appeared in 1940.

**Neilson-Terry, PHYLLIS** (b. 1892). British actress. Daughter of Fred Terry and Julia Neilson, she was born in London, Oct. 15, 1892, and studied singing at the R.A.M., making her first appearance on the stage in her parents' company under the name of

Phyllida Terson in Henry of Navarre at Blackpool, 1909. She first appeared on the London stage in the same play the following year, and made a great success as Viola in Twelfth Night at His Majesty's. 1910, later playing many Shakespearean parts, notably Desdemona, Portia, Juliet, and Oberon. Her later successes included a revival of Trilby, 1920; Craig's Wife, 1929; Lady Patricia, 1935.

Phyllis Neilson-Terry, British actress

Her brother Dennis Neilson-Terry (1895-1932) was an actor and producer. He appeared with his wife Mary Glynn in a number of mystery plays, *e.g.* The Terror, The Cat and the Canary, The Man at Six. He died while on tour in S. Africa, July 14, 1932.

**Neilston.** Town of Renfrewshire, Scotland. It stands on the Levern, 10 m. from Glasgow, with which it has rly. connexion. Chief industries are thread manufacture and bleaching. Pop. 4,000.

**Neisse.** Name of two rivers in Silesia, tribs. of the Oder. The more easterly, the Glatzer Neisse (Czech. Nidou), rises in the Sudeten mts. and flows N. It is 120 m. long, and the former fortress of Glatz and the town of Neisse (*v.t.*) are on its banks. The other rises in the Iser mts., is 140 m. long, and helps to form the boundary between Russian- and Polish-occupied Germany (Oder-Neisse line).

**Neisse** (Pol. Nysa). Town of Upper Silesia. It is a rly. junction, 30 m. S.S.W. of Oppeln, and had iron and engineering, brewing and food industries. Here were the cathedral of S. James (1195), the renaissance church of SS. Peter and Paul, and a fine guildhouse (1602). Neisse was captured from the Germans, who had made it a powerful defence point, by the Russians, March 24, 1945. Later in the same year it was taken over by Poland and the population transferred to Germany.

**Neith.** Egyptian goddess. A primitive hunting deity of the Libyan population of the W. delta, worshipped at Sais in predynastic times, she was portrayed with crossed arrows and other hunting emblems, and identified with the Greek Athena. She was afterwards represented with green hands and face as an earth-mother, and at Esneh in Upper Egypt was linked

Julia Neilson, British actress

with Khnum. Her cult regained prominence under the Saite kings of the XXVth dynasty. *See* Egypt.

**Neiva.** Town of Colombia, S. America, capital of the dept. of Huila. It stands on the Magdalena at the head of navigation for light craft, 217 m. by river S.W. of Pogotá. A cattle-exporting centre, it is reached from Girardot by train, car, or aeroplane. Founded in 1550 by Jesuits, it was destroyed by Indians in 1569, and rebuilt in 1612. Pop. 34,700.

**Nejd.** State of Saudi Arabia. Although in theory Nejd is an independent state, it is in effect united with the Hejaz (*q.v.*), since the Sultan of Nejd is also king of the Hejaz. Nejd is situated on the E. side of the Hejaz, and its capital is Riyadh, on the pilgrim road from the Persian Gulf to Mecca. *See* Arabia.

**Nell, LITTLE.** Character in Dickens's novel *The Old Curiosity Shop*. A child of 13 at the time of the story, Nellie Trent kept home for her old and failing grandfather. The account of their flight together, their wandering from place to place, the self-sacrificing love the child shows for the old man, the development of a wisdom far beyond her years in her care of him, and her final death in a country village, was for more than a generation considered one of the most moving passages in fiction. Later readers have found it over-sentimental. Dickens has recorded his own emotions after "killing" Little Nell, when he tramped the London streets all night unable to sleep.

**Nellore.** District and town of Madras state, India. The dist. extends along the Coromandel coast on both sides of the mouth of the Penner for 140 m., and includes a coast strip some 50 m. wide. Rainfall averages 35 ins. annually, but irrigation is necessary owing to its uncertainty. The chief crops are native food, grains, and rice. Mica is mined at Gudur, Rapur, etc., in the S. of the dist. The capital is a small town on the Penner where it is bridged by the Madras-Calcutta main rly. It is joined to Madras by the Buckingham Canal. Area, 7,942 sq. m. Pop. dist., 1,620,000; town, 65,000.

**Nelson.** River of Canada. It carries the waters of Lake Winnipeg in a N.E. direction into Hudson Bay after a course of 360 m. Its main tributary is the Burntwood. Because of lakes and rapids the Nelson is navigable only for short distances. At its mouth stands Port Nelson. The name is

sometimes applied to the same stream, otherwise called the Saskatchewan, before it enters Lake Winnipeg. Total length 1,660 m.

**Nelson.** Mun. borough of Lancashire, England. It is 3 m. N. of Burnley and 30 of Manchester, with a rly. station. The industries include cotton and confectionery factories, and engineering works. The chief buildings are the town hall, market hall, free library, and technical schools. There are several public parks and recreation grounds. Nelson and Colne unite to send a member to parliament. Of modern growth, Nelson was made a borough in 1890. Market day, Fri. Pop. 33,370.

**Nelson.** Town of British Columbia, Canada. It stands on the W. arm of Kootenay Lake, and is served by the C.P.R. and C.N.R., also by lake and river steamers, being 1,100 m. W. of Winnipeg. The capital of the Kootenay district, it is a centre for mining, lumbering, mixed farming, and fruit growing. Here are railway shops, sawmills, and works for making jam, cigars, etc. The buildings include a court house. Nelson dates from 1886, when a silver mine was opened in the neighbourhood. Pop. 5,758.

**Nelson.** Town of New Zealand. Situated on Tasman Bay, an indentation on the N. coast of S. Island, it is the chief town of the dist. of the same name. The surrounding country is mainly pastoral. Communication with the other large towns is by coasting steamer; a rly. runs S.W. to the Marine Mts. The first settlement was made at Nelson by the New Zealand company in 1841. Pop. 16,552.

**Nelson.** Former British battleship. Laid down 1924 and completed 1927, she was originally designed as one of the 48,000-ton battle cruisers ordered in 1921 and cancelled under the Washington treaty. Displacing 33,950 tons on a length of 660 ft. and a beam of 106 ft., she was driven by geared turbines developing 45,000 h.p. to give a maximum speed of 23 knots. She mounted a main armament of nine 16-in. guns grouped in three triple turrets; she and her sister ship Rodney were the first British warships to carry 16-in. guns, while her twelve 6-in. guns were the first weapons of this calibre to

be power-operated. Protected by 16-in. armour over the guns and magazines, Nelson was manned by 1,640 officers and men.

One of the strongest units of the Home Fleet, Nelson was mined in a Scottish loch early in the Second Great War, and after repairs was engaged in protecting convoys round the Cape. In Sept., 1941, she was torpedoed by enemy aircraft while escorting a Malta convoy. Sent to Gibraltar for temporary repairs, she returned to Rosyth with survivors from the aircraft carrier *Ark Royal*. She formed part of the fleet supporting the N. Africa landings and covering the invasion of Sicily. The conference between Gen. Eisenhower and Badoglio, resulting in the Italian surrender, took place on board. Again damaged by a mine while supporting the Normandy landings, and repaired at Philadelphia, Nelson joined the E. Indies fleet in 1945, and the Japanese surrender at Penang was signed on board. In 1948 she was listed for scrapping.

**Nelson, EARL.** British title borne by the family of Nelson since 1805. Horatio Nelson's barony, and also his title of duke of Bronte, passed on his death to his brother, the Rev. William Nelson, who, in recognition of Horatio's services, was made Viscount Merton and

Nelson, New Zealand. Looking inland from the N.W. towards the residential quarter of the town

Earl Nelson in 1805. He left no sons, and by remainder the titles passed to Thomas Bolton, a son of the admiral's sister, who took the name of Nelson and became 2nd earl. The Trafalgar Estates Act, 1946, terminated the pension payable to Earl Nelson with effect from the death of Thomas Horatio (1857-1947), 4th earl, or his brother Edward, whichever was the later. Successive holders of the earldom had received a total of £700,000 from the exchequer up to 1946. Edward (b. Aug. 10, 1860) became 5th earl on his brother's death, Sept. 30, 1947. An eldest son is known as Viscount Merton.

## HORATIO, VISCOUNT NELSON

E. W. Wilson, Author of *Nelson and His Times*

*See in addition the articles on Nelson's battles, e.g. Nile; Trafalgar; also those on his contemporaries, St. Vincent; Collingwood; and other seamen. See also Bronte; Royal Navy; Sea Power; Victory*

Horatio Nelson was born Sept. 29, 1758, the sixth child of Edmund Nelson, rector of Burnham Thorpe, Norfolk; his mother was a grand-niece of Sir Robert Walpole, and her brother, his uncle, an officer in the navy. He entered the navy in 1770 as "captain's servant" in his uncle's ship, served in the West Indies, in an Arctic expedition, and in the East Indies. He became captain in 1779; commanded the naval contingent in an unsuccessful expedition against the Spanish fort at San Juan de Nicaragua, 1780; joined Lord Hood's fleet at New York, 1782, when Hood sent Prince William, afterwards William IV, to him for information on tactics; and was employed in the West Indies, 1784-87.

In 1787 Nelson married Frances Herbert Nisbet, a widow of 26 with one son. He commanded the *Agamemnon* in the Mediterranean fleet, in 1793, under Hood; was largely responsible for the capture of Bastia and Calvi in Corsica, in 1794, when he lost the sight of his right eye by a wound; he displayed great gallantry in the action of March 13-14, 1795, with the French fleet, and was bold enough to remonstrate with his admiral (Hotham) on the feebleness which that officer displayed. He blockaded the Italian coast, and attempted to cut Napoleon's communications during the campaign of 1796. When Jervis, later Lord St. Vincent, took command of the fleet and decided to withdraw from the Mediterranean, Nelson was charged with the evacuation of Elba narrowly escaping capture by the Spaniards on his retreat.

### St. Vincent and Abukir Bay

Present at the battle of St. Vincent, Feb. 14, 1797, he secured important results by turning out of the line—contrary to orders and on his own initiative—to attack a part of the Spanish fleet which had been cut off. Of four Spanish ships taken two surrendered to him. In Feb., 1797, he became a rear-admiral, and was knighted. On July 25, 1797, he failed in a night attack on Santa Cruz, Tenerife, and his right arm, shattered by grape, had to be amputated. After some months at home, he rejoined St. Vincent's fleet, and was sent in command of a small detached squadron to watch Toulon, whence Napoleon, with 13 ships of the line under Brueys, was about

to sail for Egypt. In May, 1798, Brueys put to sea, Nelson's squadron having been damaged by a storm. Nelson was joined by reinforcements, bringing his strength up to 14 ships of the line, and hurried in pursuit. After a long search he found and destroyed the French fleet in Abukir Bay, Aug. 1, 1798. Nelson, who had entered the battle with the words, "A peerage or Westminster Abbey," was badly wounded in the head. He was made Baron Nelson of the Nile, and given a pension of £2,000.

In Sept., 1798, he went to Naples, which was under special British protection, was effusively welcomed by Lady Hamilton, wife of the British minister there, and conveyed the king and court to Palermo, when the French took Naples in 1799. On the recovery of the city he was responsible for the execution of Caracciolo (*q.v.*). Created duke of Bronte by Ferdinand I of Naples, 1799, in 1800, he returned home with Lady Hamilton, who now, as he said, became his "wife in the sight of God," and by whom a daughter, Horatia, his only child, was born to him about Jan. 31, 1801.

### Copenhagen

Sent under Sir Hyde Parker to attack Copenhagen, he commanded the squadron of 12 ships of the line, which on April 2, 1801, engaged the Danish forts and ships. The battle was fierce; at one of the most critical moments Parker, from a distance, imperilled success by making a signal of recall. Nelson put his telescope to his blind eye and fought on. Having beaten down the Danish fire and disabled many of the Danish ships he secured an armistice which gave the British all they required. For his victory he was made a viscount.

After a few weeks in England he was appointed to command the British small craft in the Channel, watching Napoleon's invasion flotilla. On Aug. 15 he directed a boat attack on the Boulogne flotilla which failed completely, with heavy loss. In Oct., 1801, as peace was imminent, he was allowed leave and went to Merton Place, Surrey, which Lady Hamilton had bought for him. Here he lived with the Hamiltons.

On May 18, 1803, on the renewal of war with France, Nelson hoisted his flag in the *Victory*, to command the Mediterranean fleet, and a few weeks later began his watch of

Toulon. He did not blockade, but cruised far out, and there were fears that the French might escape without his knowledge. In 1804 Spain joined France, and his work became more difficult. He showed great patience and determination, and, possibly as the result of a promise to Lady Hamilton, never quitted his ship. The French fleet under Villeneuve put to sea in Jan., 1805. The moment he knew, Nelson proceeded first to Sicily, which he had special orders to cover, and then to Egypt in chase. The French, however, had returned to port. "My heart is almost broke," he said of his failure to bring them to battle. In March they came out again, and, joined by one French and six Spanish ships from Cadiz, which brought their force up to 18, sailed for the West Indies.

### "The Nelson Touch"

Nelson, not knowing the direction of their movement, and so short of cruisers that he could not watch them properly, waited for definite news in a position that covered Sicily and Egypt. When information came he followed to the West Indies, rightly concluding that his business was to watch not a particular sea, but the French fleet usually stationed in it. He had with him only 10 ships of the line. He reached Barbados in June, received information which made him conclude that the French were returning to Europe, and followed them once more without delay, sending a small vessel in advance to England. She sighted the enemy on her passage, and thus the admiralty could make its plans. Nelson arrived in Europe ahead of the enemy.

The enemy had actually been encountered by Calder with 15 British battleships off Ferrol with indecisive result, and had turned south to Cadiz. Nelson, after a last visit to England and Merton, went on board at Portsmouth, where the people greeted him with tears of gratitude and love. Off Cadiz he joined Collingwood, and discussed what he called "the Nelson touch"—his plan of battle. He asked the admiralty for a strong force because, as he said, "it is only numbers which can annihilate." The enemy fleet was ordered by Napoleon to put to sea, and on Oct. 21 was fought the battle of Trafalgar.

Nelson drove the *Victory* into the enemy and was engaged by several ships. Conspicuous in his orders, he was mortally wounded by a marksman's bullet and carried below. As he lay dying, he said that he left Lady Hamilton and Horatia "as a legacy to my country." His flag-captain, Hardy, took

a touching leave of him, and, hearing that a great and decisive victory had been won, he died at 4.30 p.m. with the last words on his lips, "God and my country."

Nelson was given a state funeral in S. Paul's on Jan. 9, 1806. His brother was created Earl Nelson of Trafalgar and granted £108,000 to purchase an estate, and a pension of £5,000 a year (see Nelson, Earl). Horatia, his daughter, died in 1881, leaving many descendants of the family of Nelson-Ward. Lady Nelson received a pension of £2,000 a year, but no notice was taken of Lady Hamilton.

Nelson's decision, energy, knowledge, personal magnetism, affection for his subordinates, sympathy with his seamen, and magnificent valour made him one of the supreme leaders of men. He always aimed at decisive victory. His method of gaining it was based on a close study of tactics, in which he had excelled since 1782. He framed his plans with great originality and care, and saw that his officers thoroughly understood them, with the result that in his battles they always acted with energy and without hesitation.

**Bibliography.** Dispatches and Letters, N. H. Nicolas, 7 vols., 1844-46; Memoirs, T. J. Pettigrew, 2 vols., 1849; Hamilton and Nelson Papers, Morrison Collection, 2 vols., 1893-94; Letters to Lady Hamilton, D. Sladen, 1905; Campaign of Trafalgar, J. S. Corbett, 1910; Lives, A. T. Mahan, rev. ed. 1899; R. Southey, 1813, Everyman's Library, 1908; C. S. Forester, 1929; C. Wilkinson, 1931; C. Oman, 1947; Poseidon: a Personal Study, R. Capes, 1947.

**Nelson, Thomas, and Sons.** British publishing and printing house. Its founder, Thomas Nelson (1780-1861), was born near Stirling, son of a farmer. He started business in Edinburgh in 1798, after experience in London, and when his two sons, William (1816-87) and Thomas (1822-92), were taken into partnership progress was rapid. Thomas invented a rotary press (1850), and other devices affecting bookbinding, photo-zincography, stereotyping, etc. From the publication of cheap religious works the firm went on to issue juvenile literature, gift books, Royal Readers, and other educational works. The London house was established in 1844. The third Thomas Nelson, a grandson, was killed in the First Great War, and was succeeded as director by his brother Ian, who had as co-director for several years the novelist John Buchan, later 1st Lord Tweedsmuir (q.v.). The firm re-

tains its reputation for juvenile and educational works and for its libraries of cheap reprints from well-known works.

**Nemathelminthes, or NEMATODA.** The round worms, a group of acoelomate animals with elongated spindle-shaped bodies. Some genera are abundant in the soil, some in fresh water, and others in the sea, but the best-known forms are internal parasites of animals and plants. These last usually have a complex life history associated with the need to pass from host to host. Well-known examples are *Ascaris*, species of which occur commonly in man, the horse, and the pig; *Ankylostoma*; and *Filaria*. See Ankylostomiasis; *Ascaris*; Filariasis.

**Nemea.** Valley in Argolis, ancient Greece. Here Hercules was said to have killed the Nemean lion, and here, in the precincts of a temple to Zeus, were celebrated every two years the Nemean games, one of the four great athletic festivals of Greece. See Ludi.

**Nemertea** (Gr. *Nemertes*, the sea-nymph daughter of Nereus). In zoology, a class of flat worms, most of them marine. One or two species occur on land, and a few in fresh water. They are long and ribbon-shaped, without limbs, and vary in size from minute forms to one marine species which is often nearly 100 ft. in length. The most remarkable feature of the Nemerteans is the long, retractile proboscis, forming a tube within the body which can be partly everted and extruded. It is flung out like a lash, which coils round the body of its victim and draws it to the mouth. In some species this proboscis has a spike connected with a poison gland. See Worm.

**Nemesis.** In Greek mythology, daughter of Night and one of the deities of the nether world. She was the goddess of vengeance, punishing the guilty, but at the same time rewarding virtue, and thus became the personification of respect for law and justice.

**Nemi.** Crater lake of Central Italy. It is in the Alban Hills, between Velletri and Albano, 20 m. S.E. of Rome. It is  $3\frac{1}{2}$  m. in circuit, 110 ft. deep, and lies at an alt. of 1,060 ft.; area 70 acres. Of great beauty, it was called the Mirror of Diana, whose temple was in a neighbouring grove. It is still drained by a tunnel excavated by the Romans. Remains of two state barges of Caligula's time have been recovered, as also many other Roman relics, including mosaics, bronze ornaments, rings, etc.

**Nemophila.** Genus of annual herbs of the family Hydrophyllaceae. *N. insignis* was introduced from North America in 1822; it bears conspicuous saucer-shaped blue flowers with white centres, and flourishes in open borders when sown in early spring, or indoors in leaf-mould.

**Nemours.** Town of France. In the dept. of Seine-et-Marne, it is 10 m. S. of Fontainebleau. It stands on the Loing, while a rly. line connects it with Paris. The chief buildings are the 16th century church and a castle. Nemours was the chief town of a county, which in 1404 was made a duchy for the king of Navarre. This belonged in turn to the families of Bourbon, Armagnac, and Foix. After the death of Gaston de Foix in 1512, the duchy passed under various rulers until, about 1670, it was given by Louis XIV to his brother Philip, duke of Orléans. The Orléans family held it until the Revolution. Population (estimated) 5,000.

**Nen or NENE.** River of England. It rises in the W. of Northamptonshire and flows S.E. to Northampton, where it takes a north-easterly direction past Wellingtonborough, Thrapston, Oundle, Peterborough, and Wisbech to the Wash, which it enters 3 m. below Sutton Bridge. It has a canal communication with all the central waterways of England, and is navigable for small vessels. Its length is 90 m.

**Nenagh.** Market town and urban district of Tipperary, Eire. It stands on the river Nenagh, 27 m. by rly. N.E. of Limerick. The well-preserved castle was built in the reign of John of England; in 1651 it was taken by Ireton as Cromwell's deputy. Pop. 4,517. The river Nenagh is 14 m. long and falls into Lough Derg.

**Nennius.** A Welsh historian. Little is known of him, save that he lived in S. Wales and wrote in Latin a History of the Britons, completed in 796. To him are due many of the stories told about King Arthur and the Round Table, but the worth of his work is seriously questioned.

**Nentsy.** People of the R.S.F.S.R. They dwell in the Samoyedes or Yamal peninsula, in Omsk prov., and their chief town is Salegards, or Salokhard, on the Arctic Circle near the mouth of the Ob. See Samoyed.

**Neoarsphenamine.** For this arsenical compound used in the treatment of syphilis, see Neosalvarsan.

*Nelson D. Brantz*

1. As a midshipman, from a painting attributed to T. Gainsborough. 2. As a captain, at the age of 22, after J. F. Rigaud. 3 and 4. Two portraits of Nelson in 1801, as vice-admiral, by Lemuel Abbott. 5. The famous signal flown from the Victory before the battle of Trafalgar. 6. As vice-admiral, after J. Hoppner. 7 The Death of Nelson in the cockpit of the Victory, Oct. 21 1805; from the painting by A. W. Devis

**NELSON: BRITAIN'S NAVAL HERO BEFORE AND AFTER TRAFALGAR**

**Neo-Caesarea**, SYNOD OF. Synod of the Church, held about 315 at a town in Pontus. It passed canons dealing with eccles. discipline, decreeing, *inter alia*, that a priest who married after ordination must be deposed; that no priest might attend a second marriage; and that no one should be ordained under 30 years of age. At a second synod of this name, held about 358, Bishop Eustathius of Sebasté was condemned.

**Neocomian**. In geology, the name given by J. Thurmann to the lowest stage of the Cretaceous system of rocks, usually taken as being synonymous with the Lower Cretaceous. See Cretaceous.

**Neodymium**. One of the rare earth metals. It is so closely associated with praseodymium that until 1885 they were thought to be one element, didymium. Then Welsbach distinguished two separate elements. The precipitated oxalate of neodymium is insoluble in potassium sulphate, as are those of lanthanum, cerium, praseodymium, and samarium. The element, chemical symbol Nd, has an atomic number of 60; atomic weight, 144.27; specific gravity, 6.96; melting point, 840° C.; crystal form, hexagonal, with lattice constants  $a=3.650$  and  $c=5.890$ . Neodymium has been used for giving an amethyst-red colour on porcelain. Didymium salicylate has been tested as a non-irritant antiseptic dressing for wounds. There are a basic sesquioxide,  $Nd_2O_3$ ; a dioxide,  $NdO_2$ ; and possibly a hydrated pentoxide,  $Nd_2O_5 \cdot xH_2O$ . Neodymium forms other salts and may be prepared by fractionation of the double magnesium nitrate. See Rare Earths.

**Neo-Impressionism**. School of painting, an offshoot of Impressionism (*q.v.*). The neo-impressionists carried to extreme limits the analysis of light by the division of colours, *i.e.* the juxtaposition of minute strokes of different primary colours. The movement had a scientific basis, but in the hands of its chief exponents, *e.g.* Seurat, Lucien Pissaro, Signac (*q.v.*), the limitations of the scientific approach were balanced by a return to a greater sense of artistic design than the Impressionists had allowed to be necessary.

**Neolithic** (Gr. *neos*, recent; *lithos*, stone). Term used to denote the later phase of the prehistoric, Stone Age civilization which preceded the use of metals. It is distinguished from the older

Palaeolithic and Mesolithic phases by the polishing and grinding of its stone tools and weapons, which gives them much greater strength than the chipped flints of earlier ages.

It is not, however, from lithic industries as such that the later Stone Age derives its importance in human history. Kitchen-middens, lake-dwellings, inhabited caves, burial mounds, and megalithic stone monuments, the menhirs and dolmens of W. Europe, show that Neolithic man achieved momentous advances in other directions too. Among these were the inventions of basketry, weaving, and pottery, and, most important, the domestication of animals and plants, which turned men from mere hunters and fishers into herdsmen and farmers. The development of agriculture and the more settled life which it brought was the foundation on which civilization could arise. The more abundant food supply enabled the population to increase and stable communities to develop, among which can be traced the beginnings of stone and timber architecture, navigation, and trade. The dead were treated with respect and provided with tombs, *e.g.* the long barrows of the English countryside; religious beliefs were bound up with the attempt to secure the maximum fertility of animals and crops by coming to terms with the unseen powers of nature.

#### Near Eastern Origin

Neolithic culture seems to have arisen in the Near East, and primitive farmers early made their way into the alluvial lands along the Tigris and Euphrates and in the Nile valley, where conditions made farming easy. Neolithic man was already well established in these regions in the 5th millennium B.C. Seafaring activity is traceable in the Aegean by 4,000 B.C. The Near East now forged ahead in the arts of civilization, while the basic features of Neolithic culture were disseminated through Europe during the 3rd millennium B.C. The Stone Age began to pass from Europe after 1900 B.C., when the manufacture of bronze implements began in Hungary and Bohemia.

Although the Stone Age was succeeded among all the progressive peoples of the Old World by an age of metals, there have survived to modern times in every continent primitive peoples whose cultural outlook remained Neolithic even after the existence of metals was learned from external

sources. The New World was peopled in a distant past by bands of Neolithic folk from Asia, who developed through centuries of isolation the cultural elements brought with them. The result was that aboriginal America was still Neolithic at the European discovery. See Anthropology; Callernish; Man; Stone Age.

**Bibliography.** The New Stone Age in Europe, J. M. Tyler, 1921; Our Early Ancestors, M. C. Burkitt, 1926; Dawn of European Civilization, V. G. Childe, 2nd ed. 1939.

**Neon**. Gaseous element; at. no., 10; at. wt., 20.183; density, 0.89990 gm per l. at N.T.P. It is present in the atmosphere in the proportion of about one part in 80,000. It occurs mixed with argon, and was discovered by Sir William Ramsay in 1898 when examining a large quantity of argon. This latter gas was liquefied, and it was found, as the temperature was raised, that a lighter gas than argon was present. To this the name neon ("new") was given. Only two years later could enough of the gas be collected for an extended study. The neon spectrum consists of a great number of red, orange, and yellow lines. Chemical symbol Ne.

**Neon Lighting**. The production of light by the passage of an electric current through a tube containing neon gas is the most common form of luminous tube lighting. At atmospheric pressure all gases are virtually non-conducting. In a tube containing a gas at sub-atmospheric pressure, however, the gas becomes more conductive; and the lower the pressure, the lower the voltage which is required to produce a discharge. Neon gas giving a characteristic red glow needs the lowest voltage per unit length and diameter of tube.

A luminous discharge tube is an evacuated glass tube at both ends of which are electrodes consisting of pieces of metal which are introduced into the tube through a seal. The passage of a current causes electrons to pass between the electrodes with such velocity that they collide with gas particles in the tube. This dislodges positive ions and more electrons. The resulting breaking up of gas molecules by bombardment releases energy which appears as light.

For a tube 20 ft. in length and approximately  $\frac{1}{2}$  in. in diameter, the working voltage for neon gas would be about 3,000 volts A.C. The tube would not start to glow,

however, until about 6,000 or 7,000 volts had been applied. To enable this to be done and to use public electric supply voltages, a special type of transformer is needed; this gives the necessary high voltage on starting, but as soon as the tube lights up the transformer reduces its output pressure to the required figure.

Other gases give different colours, e.g. helium—blue; nitrogen—golden white; carbon dioxide—white; argon—purple. Other hues are obtained by using coloured glass, or putting in the tube a drop of mercury which volatilises and gives a greenish-blue glow to the discharge. Alternating current is necessary for all but the smallest lamps, which can operate direct on mains voltage (A.C. or D.C.). Where direct current is supplied for luminous tube lighting, a D.C. to A.C. converter is necessary.

**Philip Honey**

**Neophyte** (Gr. *neos*, new; *phyein*, to plant). Term applied in the early Christian church to newly baptized converts, as distinguished from the catechumens (*q.v.*). The word is explained by Gregory the Great as meaning "newly planted in the faith." Neophytes wore white garments for eight days after baptism. S. Paul instructs Timothy (1 Tim. 3, v. 6) not to make a neophyte a bishop, but this prohibition was sometimes disregarded in exceptional cases, S. Ambrose being elected bishop of Milan before being baptized, and installed a few days after. The term is also applied to those newly admitted to the priesthood, or to a religious order.

**Neo-Platonism.** System of philosophy which attempted to replace the dualism of mind and matter by monism (*q.v.*), and to solve the problems of virtue and knowledge on a religious basis. Essentially eclectic, it held Pythagorean, Aristotelian, Platonic, Stoic, Christian, Jewish, and other Oriental elements. Three distinct schools of neo-Platonism were: Alexandrian, Syrian, Athenian.

The keynote of the system is supposed direct intercourse with the absolute divine being as the result of ecstatic visions. There are three cosmical principles: the One, absolute unity, which creates by emanation the Logos (word, reason), containing the ideas of things, which in turn produces the Soul, the principle of movement, which represents the ideas in the external world. Individual souls hover between reason and sense, ever striving to free themselves

from the shackles of matter, and to return to the world of ideas, there to be absorbed and lost in God. Although it failed as a popular religion, neo-Platonism left permanent traces, seen in Augustine and Boëthius, in Giordano Bruno, and Jacob Boehme, in Fichte and Schelling, and modern theological speculations such as those of W. R. Inge (*q.v.*). See Philosophy.

**Neoprene.** Form of synthetic rubber, and the first to be commercially successful. Introduced in 1931, it is produced from chlorine, lime, and coke treated in a high-temperature electric furnace. Although neoprene is considerably dearer than natural rubber, it is more resistant to the deteriorating action of sunlight and heat, petrol and lubricating oils, and many chemicals. See Rubber, Synthetic.

**Neoptolemus or Pyrrhus.** In Greek legend, son of Achilles. He joined the Greek forces before Troy in the tenth year of the war, a soothsayer having declared that the assistance of Neoptolemus and Philoctetes was necessary to end the war. Neoptolemus was one of those who were concealed in the Wooden Horse—the stratagem which led to the fall of the city. He killed with his own hand Priam, the king, whose daughter, Polyxena, he sacrificed to the shade of Achilles. At the distribution of the spoil, Andromache, Hector's widow, fell to his lot. He later married Hermione, daughter of Menelaus, and was slain at Delphi by Orestes, to whom Hermione had been promised.

**Neo-Pythagoreanism.** An attempt to revive the doctrines of Pythagoras, combined with Peripatetic, Stoic, and Oriental elements, which originated at Alexandria in the 1st century B.C. Its chief representatives were Nigidius Figulus, a friend of Cicero, and Apollonius of Tyana. Many forged treatises were put forward by enthusiasts as genuine works of Pythagoras (*q.v.*).

**Neosalvarsan.** An organic arsenical compound used in the treatment of syphilis. It is a yellow powder containing 19–22 p.c. of arsenic in the trivalent form. Fresh solutions are given by intravenous injection. See Arsphenamine.

**Neosho.** River of the U.S.A. Rising in the east-central part of Kansas, it flows S.E. and S. into Oklahoma, where it turns S.W. by S. to the Arkansas river, near Fort Gibson. Its length is nearly 400 m.

**Neozoic** (Gr. *neos*, new; *zōe*, life). In geology, all the strata

from the Trias to recent times. The word has been used by some geologists as synonymous with the Cainozoic era.

**Nepal.** Independent kingdom of the Indian sub-continent. It lies N. of the plains among the Himalayas, and adjoins Tibet on the N., and Sikkim on the E. Dhaulagiri and Everest are within the state, which is drained by the upper waters of the Gogra, Gandak, and Kosi. The lower slopes are rainy and forest covered, yielding sal and sisu trees; the valleys are cultivated for rice, millets, tobacco, and oil seeds. Some of these crops are exported in exchange for cottons and metal goods.

The government is a military oligarchy, royal authority being invested in the prime minister, who is always of royal blood and is commander-in-chief of the army. The aboriginal stock is Mongolian, the Gurkhas being predominant; the religion of the great majority is Sanatan, an ancient form of Hinduism. The appointment of the British envoy who resides at the capital, Khatmandu, was in 1934 raised to that of envoy extraordinary and minister plenipotentiary, and a Nepalese representative of the same rank is appointed to the Court of St. James. A narrow-gauge rly. was opened in 1927 connecting Amlekhganj with Raxaul on the Bengal and N.W. rly., 25 m. distant; and in 1940 a second line was constructed from Jayauagar on the frontier to Bijulpara, 33 m. A motor road runs 27 m. from Amlekhganj to Bhimpheidi. A topographical survey was carried out in 1927 by Indian personnel of the government of India. The hydro-electric supply system was constructed in 1933. In 1937 the Bank of Nepal was established in Khatmandu and Nepalese currency notes put in circulation.

Relations between Nepal and Great Britain have been friendly since the treaty of Sagauli, Dec., 1815, which ceded the provs. of Garwhal and Kumaon to India. Gurkha troops fought in great numbers during the two Great Wars, not only in their own battalions but also in the ranks of the Assam Rifles, the Assam Regiment, and the Burma Rifles, of which they formed the bulk. Area 54,000 sq. m. Pop. est. 7,000,000. See Gurkha; Khatmandu. *Consult* Nepal, Land of Mystery, H. Davis, 1942.

**Nepenthes.** Genus of insectivorous plants, commonly known as pitcher-plants (*q.v.*).

**Nepheline.** NEPHELITE, or ELEOLITE. A member of the feldspathoid group of minerals, consisting of sodium aluminium silicate ( $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$ ). Some potassium is always present in the natural mineral. The feldspathoid group are characterised by a deficiency of silica as compared with the feldspar group (*q.v.*). This deficiency of silica restricts the occurrence of the feldspathoids to igneous rocks low in silica and rich in alkalis. Hence nepheline is found as glassy hexagonal crystals and grains in phonolites, nepheline-basalts, nepheline-syenites, etc. Eleolite is a massive, dark-coloured variety. Nepheline is worked in the U.S.S.R. as a source of aluminium, as that country has poor resources of the richer aluminium deposits (bauxites). Some varieties of nepheline are used as gemstones.

**Nephtin.** Mountain of Eire. One of the highest summits in co. Mayo, it is situated 10 m. S.W. of Ballina; alt. 2,646 ft. To the W. is Nephtin Beg, alt. 2,065 ft.

**Nephoscope** (Gr. *nephos*, cloud; *skopein*, to observe). In meteorology, an instrument for measuring the motion of clouds. Two types are in general use. Fineman's consists of a horizontal circular mirror and a vertical pointer, carrying a scale, raised or lowered by a rack and pinion. The instrument may be adjusted until the images of the cloud and the pointer are in line with the centre of the mirror. The radius along which the cloud appears to move then gives the direction from which it is coming. In the Besson direct vision method a comb, composed of a number of short upright equidistant spikes, is mounted at its centre on a tall vertical rod. The latter is rotated until the cloud appears to travel along the line of the spikes. The direction is then read off a graduated dial. The movement of the cloud or its image across the spikes or mirror provides a measure of the angular velocity of the cloud, and its linear velocity can then be calculated. See Cloud; Meteorology.

**Nephridium.** Zoological term. It refers to a duct of excretory function in the primitive condition, which is found in a number of animals. In the segmented worms nephridia are a series of metamerically arranged pairs of tubules, each opening to the exterior by a nephridiopore. Internally they either end blindly in a

flame cell (a protonephridium), or project through the coelomic epithelium into the coelomic cavity (metanephridium). They develop independently of the coelom and are to be distinguished from the coelomoduct, primitively a genital duct, which in some animals assumes an excretory function.

**Nephrite** (Gr. *nephros*, kidney). In geology, a variety of amphibole. White to dark green in colour, it is a calcium magnesium ferrous silicate, and has been highly valued as an ornamental stone in all countries and ages. Carved ornaments of nephrite have been found among the remains of primitive man in large numbers in China and Mexico, Switzerland, Germany, France, etc. The word jade is used to describe this mineral and jadeite, as they are extremely similar in appearance. Jadeite, however, is easily fusible, whereas nephrite is infusible. See Jade.

**Nephritis.** Inflammation of the kidney. It may be acute or chronic. Acute nephritis may follow exposure to cold and wet; poisoning by substances which irritate the kidneys, such as cantharides or turpentine; and may occur in the course of scarlet fever, enteric, measles, diphtheria, chicken-pox, and other diseases. It may also be associated with syphilis and tuberculosis. When due to exposure to cold, the onset is abrupt. When occurring in the course of fevers, the symptoms appear more gradually. Shivering fits and rise of temperature, with suppression of urine, may be the first signs. Dropsy occurs early, and may be first observed as a puffiness of the face, or swelling of the ankles.

The patient should be kept in bed, and the kidneys relieved of their functions as much as possible, by stimulating the excretory activities of the skin and bowels. Sweating may be induced by hot air or vapour baths. The bowels should be kept open by saline purges. Pain in the back may be relieved by the application of hot fomentations. Dropsy of the abdomen or of the chest may necessitate removal of some of the fluid by aspiration. See Bright's Disease.

**Nephtys.** Egyptian goddess, perhaps personifying the dusk. The name is the Grecised form of Nebt-het, lady of the house.

She was the wife of Set and sister of Isis, whose lament over the bier of Osiris she shared. Portrayed as a woman crowned by her hieroglyphic symbol—perhaps a house and basket—she was worshipped

at Edfu, Dendera, and elsewhere. See Egypt.

**Nepos.** CORNELIUS. Roman writer of the 1st century B.C. A friend of Cicero, he wrote voluminously on many subjects, but everything has been lost, except a section of a work entitled *Illustrious Men*. This is of no value as a contribution to history, but the simplicity of its style has made it a favourite text-book for beginners in Latin.

**Nepotism** (Lat. *nepos*, grandson). Term applied to the practice of showing undue favour to relatives, especially by ministers of state or others exercising patronage. In Church history the term is applied to the abuse of eccles. patronage by popes and bishops.

**Neptune.** In Roman mythology, the god of the sea, identified with the Greek Poseidon (*q.v.*).

**Neptune.** Eighth planet of the solar system, in order of distance from the sun. Its discovery is remarkable for the fact that its orbit was calculated by Leverrier and Adams before the planet had itself been seen. It was first actually seen by Galle, of Berlin, who found it from particulars supplied by Leverrier on Sept. 23, 1846. It can be seen only with telescopic aid. On Oct. 10, Lassell discovered a satellite, Triton, which was not photographed till 1899 at Pulkova.

The distance of Neptune from the sun is 2,796,600,000 m., and its period of revolution about the sun is 165 years. Its satellite revolves about the planet in a retrograde direction, E. to W., in 5 days 21 hours. Neptune's diameter is 30,900 m., its mass  $17\frac{1}{2}$  times that of the earth, and its mean density 1.61 times that of water; it is thus very similar to Uranus. Its spectrum shows strong bands in the red region identified by Dunham in 1932 as due to methane. Absorption produced by these bands gives the planet its characteristic green colour; a layer of methane 25 m. deep would be needed to produce the observed absorption. The planet shows a small disk with no permanent markings, so no direct evidence of the length of its day can be obtained. Spectroscopic observations suggest a rotation period of about 16 hours, and this is confirmed by the extraordinarily rapid motion of the plane of Triton's orbit, which must be produced by the attraction of an equatorial bulge on Neptune. The rotation is direct, i.e. opposed to that of Triton. See Planet; Sun.

**Neptunium.** Artificial element first obtained in 1940 by bombarding uranium 238 with neutrons; at. no., 93; chemically similar to uranium. Six known isotopes (Np 234 to 239) are all radio-active, with half-lives ranging from 20 hours to 2½ million years.

**Nereis.** Genus of polychaete (many bristled) sea worms. The body consists of a long series of segments, each bearing numerous chaetae or bristles. They have a definite head with tentacles and four eyes. They live in burrows.

**Nereus.** In Greek mythology, an ocean deity with the gift of prophecy. He was represented as an old man with the tail of a fish or serpent. He had 50 daughters, the Nereids, one of whom was Thetis, the mother of Achilles.

**Neri** (Ital., blacks). Name given about 1300 to a faction in Florence. During a quarrel about the way in which the city should be governed, the nobles were split up into two parties, the Neri headed by the Donati family, and the Bianchi (whites) by the Cerchi. This feud disturbed the peace of Florence during the early 14th century. Charles of Valois intervened on behalf of the Neri, and the exile of Dante was due to their hostility. See Florence.

**Neri, PHILIP** (1515-95). Italian priest and saint, founder of the Oratorians. Born at Florence,

S. Philip Neri,  
Italian priest

July 21, 1515, he refused to become heir to his uncle, a wealthy merchant. In 1533 he went to Rome and studied theology. He visited the sick, founded a hospital,

established in 1548 a Confraternity of the Holy Trinity, and delivered daily addresses which attracted princes and cardinals. Ordained priest in 1551, he began five years later to form a number of young men into the Congregation of the Oratory, an order of priests and laymen observing a common rule, but not under vows, their aim being to teach the ignorant and convert the worldly. Remarkable for cheerfulness as well as piety, he died May 25, 1595, and was canonized in 1622. See Oratorians. *Consult* Life, P. J. Bacci, 1622, Eng. trans. 1902; S. Philip Neri and the Roman Society, L. Ponnelle and L. Bordet, Eng. trans. 1932.

**Neritic Deposits** (Gr. *nērītēs*, mussel). In geology, marine de-

posits which have been formed near shore-lines and are largely composed of organic remains, e.g. shelly sands, gravels, coral reefs. They are distinguished from pelagic deposits, which are formed in the deep sea. See Coral; Geology.

**Nernst, WALTER HERMANN** (1864-1941). A German chemist. Born at Briesen, W. Prussia, June 25, 1864, he was educated at Zürich and Berlin universities, and in 1887 was assistant in the Ostwald chemical laboratory, Leipzig. During 1891-94 he was professor of chemistry at Göttingen, and from 1905 held the similar chair at Berlin, where in 1925 he became director of the physics institute. Nernst did fundamental work on reversible galvanic cells and made original contributions in the diffusion, hydration, and dissociation of electrolytes. He established a method of measuring vapour densities at high temperatures, and enunciated the third law of thermo-dynamics. He was awarded the Nobel prize for chemistry in 1920. An incandescent electric glow lamp invented by Nernst was more efficient, though more complicated, than the carbon filament lamp; displaced for general purposes by the metal filament lamp, it is still used in scientific work where concentrated light is required. Nernst died in Berlin, Nov. 18 or 19, 1941. His chief book, *Experimental and Theoretical Applications of Thermo-dynamics to Chemistry*, has an Eng. trans.

**Nero.** Mountain of Italy, a peak of the Julian Alps, in the compartimento of Venezia Giulia. It is 7,370 ft. in height, and 7 m. N.E. of Caporetto. The mountain and region figured in the battles of the Isonzo fought between the Austrians and Italians, 1915-17.

**Nero** (37-68). Roman emperor. Originally named Lucius Domitius Ahenobarbus, he was born Dec. 15, 37, and was the stepson of the emperor Claudius, by whom he was adopted in 50, thenceforth bearing the name of Nero. On the death of Claudius in 54, Nero was made emperor. For the five years of his minority the empire was well administered. Then Nero threw aside his tutors and ministers, and for nine years indulged in that orgy of tyranny which has made his name a byword for all time. His tutor Seneca, his mother Agrippina, his wife Octavia, were all done to death; anyone who offended him, or whom he distrusted, was murdered with or without the form of law.

He plunged into licentious dissipations, and shocked all Roman conventions by posing publicly as

Nero,  
Roman emperor

a musician and an artist. In 64 fires broke out in Rome by which half the city was consumed: men whispered that the destruction had been planned by the emperor himself. But Nero announced that the things had been done by the obscene sect of the Christians, upon whom a frightful persecution was let loose. Life in Rome became a nightmare; the horror grew till Galba, one of the provincial generals, led his troops upon Rome. In the face of danger the coward emperor fled, and when he heard the tramp of the approaching troops, died by his own hand, 68. Theatrical to the end, his last words were "What an artist is lost in me!" See Agrippina. *Consult* Lives, B. W. Henderson, 1903; A. Weigall, 1930.

**Nertchinsk.** Town of E. Siberia, R.S.F.S.R. It is in the prov. of Transbaikalia, on the Nercha, and a station on the Siberian rly., 530 m. E. of Irkutsk. The inhabitants of the district are chiefly occupied in agriculture, cattle rearing, tobacco cultivation, and hunting furred animals. There are lead and silver mines near.

**Nerva, MARCUS COCCURIUS** (32-98). Roman emperor. A man of eminent respectability, though not of great capacity, he was chosen emperor on the assassination in 96 of Domitian after whose tyranny his mild rule was a welcome relief. Nerva took an oath that he would put no senator to death, suppressed the worst of the informers who had disgraced the latter part of Domitian's reign, and interested himself in public charity. He adopted Trajan and died Jan. 27, 98.

**Nerval, GÉRARD DE.** Adopted name of the French writer, Gérard Labrunie (1808-55). Born in Paris, May 21, 1808, he was the son of a doctor. Taught by his father several languages, he read widely and, of a studious and eccentric nature, he soon began to write. In 1828 he translated

Gérard de Nerval,  
French author

Faust, and volumes of verse and prose appeared until, following an attack of insanity, he committed suicide, Jan. 25, 1855. Nerval's best work is in his fantastic stories, *Contes et Facéties*, 1852, and *Les Filles du Feu*, 1854, though Aurélie has special interest as a record of his own madness. Sylvie, 1848-50, is also noteworthy. He also wrote comedies, a drama, and articles for periodicals. Among his friends were Gautier and Dumas. His complete works, appeared in 1876.

**Nerve.** Cord-like structure composed of nerve fibres, i.e. long branches of nerve cells which convey impulses from one part of the body to another. Nerves which exist in the brain or spinal cord are called efferent nerves, and those which carry impulses from the periphery to nerve centres are known as afferent nerves. If, for example, a painful stimulus is applied to the hand, the impression is conveyed by afferent nerves to the brain, which then sends out an impulse through efferent nerves, which withdraws the hand from the source of pain. See Brain; Ganglion; Neuron.

**Nervo and Knox.** British music hall comedians. James Holloway (who adopted the name Jimmy Nervo) was a Londoner, born Jan. 2, 1898, and Albert Edward Cromwell Knox, born July 12, 1896, came from Newcastle-upon-Tyne. Their knockabout fun became famous from their first appearance as members of the Crazy Gang at the Palladium, London, 1931. They were in a number of royal command performances.

**Nervous System.** System of nerve cells and nerve fibres which control or regulate the actions and functions of every part of the body. The nervous system consists of two main divisions, the cerebro-spinal system, comprising the brain and spinal cord, and the vegetative or autonomic, consisting of the sympathetic nervous system, and certain other ganglia, i.e. aggregations of nerve cells and fibres. The cerebro-spinal system controls the movements of muscles and carries out actions consciously directed by the individual. The autonomic system regulates functions and actions which are not under voluntary control, e.g. the peristaltic movements of the intestine and the processes of digestion. The two systems are, however, not entirely independent.

Diseases of the nervous system may be divided into two main

classes: (1) Functional nervous diseases (or more properly disorders), in which no pathological changes in the system can be detected. (2) Organic diseases associated with degeneration in the nerves or nerve cells following injury—for example, a blow on the head, or rupture of an artery in the brain, as in apoplexy; chronic poisoning, as in alcoholic neuritis; effects of micro-organisms, as in diseases of the nervous system due to syphilis; and other causes yet unknown.

Nerves also exercise a nutritive action upon the parts they supply. Thus, when the nerves directly supplying a group of muscles are severed, as for instance by a gun-shot wound, the muscles cease to respond to stimuli, and show marked wasting. When the injury or degenerative process is not in the nerve immediately supplying the part, but is situated in a higher nerve centre, such as the brain, which controls the lower nerves, then the condition known as spastic paralysis is produced, in which stimuli produce jerky, exaggerated movements, and the muscles are usually less wasted. See Apoplexy; Brain; Disseminated Sclerosis; Ganglion; General Paralysis of the Insane; Hysteria; Infantile Paralysis; Locomotor Ataxia; Meningitis; Motor Nerves; Myelitis; Neuralgia; Neurasthenia; Neuritis; Neurosis; Paralysis; Paraplegia; Spinal Cord. Consult Integrative Action of the Nervous System, Sir C. Sherrington, new ed. 1947.

**Nesbit, Edith** (1858-1924). British poet, novelist, and writer of children's stories. Born in London and educated in France and Germany, in 1879 she married Hubert Bland (1856-1914), and the two were original and active members of the Fabian society. She published several books of poems and some somewhat sentimental novels, e.g. *Thirteen Ways Home*, 1901, but is chiefly remembered for her many delightful stories for children published regu-

larly between 1899 (*The Would-be Goods*) and 1913 (*Wet Magic*), especially the series dealing with the Bastable (*q.v.*) family, and another group of related tales, *Five Children and It*, 1902; *The*

**Nervous System.** Diagram of the network of nerves in the human body seen from the back

*Phoenix and the Carpet*, 1904; and *The Story of the Amulet*, 1906. Many of her stories were first serialised in the *Strand Magazine*. She died May 4, 1924. Consult Life, D. L. Moore, 1933.

**Ness.** Topographical term for a cape. It occurs in place-names on the E. and S. coasts of Great Britain, e.g. Sheerness, Buchan Ness, Dungeness. Like naze, it is akin to nose.

**Ness.** River of Scotland, in the co. of Inverness. It comprises the 7 m. waterway from Loch Ness to Moray Firth, and is noted for its salmon-fishing. Parallel with it is the N. section of the Caledonian Canal. See Inverness.

**Ness, Loch.** Lake in Inverness-shire, Scotland. It forms a part of the Caledonian Canal, and lies in the valley of Glenmore, receiving the waters of the Oich, Morriston, Foyers, Tarff, and other rivers, while its surplus waters are carried to the Moray Firth by the river Ness. Length 22½ m., average breadth about 1 m., greatest depth 754 ft.

The legend of the Loch Ness monster dates from the summer of

1933, when apparently reliable witnesses, including a local minister, reported that a marine creature—estimated by one observer as 60 ft. long—had appeared in the waters of the loch. It was described as having a small head on a long neck, and a long body with a number of humps; it could swim fast, but mostly remained just below the surface. A watch party in 1934 took photographs which appeared to establish the presence of some large and unfamiliar creature; but its identity remains a mystery.

**Nesselrode, CHARLES ROBERT, COUNT** (1780–1862). Russian diplomatist. Born at Lisbon, Dec. 14,

*Signature of Charles Robert Nesselrode*

1780, he was the son of the Russian minister there. Educated partly in Berlin, he spent some time in the navy and army before entering the diplomatic service. He gained experience of un-

rivalled value, and also the friendship of Talleyrand and Metternich, during the European negotiations of which Napoleon was the central figure, 1807–11. He accompanied the Russian army that invaded France in 1814, and at the congress of Vienna was the chief instrument of the tsar Alexander I in pressing for the policy of the Holy Alliance. He was minister for foreign affairs from 1815 until 1856. Although Alexander's successor, Nicholas I, did not always act upon his advice, Nesselrode was the most influential Russian statesman of his day. He died March 23, 1862. His letters and papers were edited by A. de Nesselrode, 1904.

**Nessler's Reagent.** Alkaline solution of mercury and potassium iodide, employed as a test for ammonia, with traces of which it gives a yellow colour, and with larger quantities a brown precipitate. On account of the delicacy of the test it is adopted for detecting ammoniacal impurities in drinking water.

**Nessus.** In Greek mythology, one of the Centaurs. Having attempted to carry off Deianeira, the wife of Hercules, he was shot by the latter with a poisoned arrow. Nessus, when dying, gave Deianeira his infected cloak or shirt, declaring that it would win back the love of her husband should he prove unfaithful. The jealous wife sent Hercules the cloak, which he

put on, and died in fearful agony. Nessus's shirt is proverbial for an intolerable burden. *See* Centaur; Deianeira; Hercules.

**Nest.** Shelter constructed by an animal for the purpose of rearing its young. The nest-making instinct is common to a large part of the animal world. Among mammals most of the rodents construct nests or nursing chambers, those of mice being familiar, and many of the insectivores have the same habit. Many fishes, e.g. the common stickleback, build nests. Among the insects bees, wasps, and ants construct elaborate nests in which to rear their larvae, and many spiders make nests of silk, in which the eggs are deposited and the young kept for a time.

Nest building has attained its highest development among the birds as a class, culminating in the wonderful constructions of the weaver birds and tailor birds. As to some of the gregarious birds, a huge structure is built which contains the individual nests of many pairs.

Generally the most elaborate nests are made by those species

whose young are most helpless in the earlier stages of life. Where, as in the game birds, the young are able to run about and pick up food soon after being hatched, the nest is almost always on the ground and of simple construction. Birds, like finches, which have many enemies take the most pains to conceal their young, either by placing the nest in an inaccessible spot, or by covering the outside with lichens or other material to match its surroundings. *See* Bird; Cassiques.

**Nestor.** In Greek legend, king of Pylos, who in spite of his years took part in the Trojan War, in which his counsel was highly valued. As a young man, he had taken part in several adventures, including the expedition of the Argonauts and the hunt for the Calydonian boar. He was one of the few Greek leaders to reach home safely after the fall of Troy. *See* Troy.

**Nestorianism.** Christian heresy which caused the council of Ephesus in 431 formally to define the dual nature of Christ. It is named after Nestorius, conse-

Nest. Various forms of nest built by common British birds. 1. Coot, floating on water. 2. Redstart, hole in wall or tree. 3. Willow warbler on the ground among bracken. 4. Wild duck, under bushes or hedges. 5. Nightingale, built of dead oak leaves on grass, at the base of bushes. 6. Reed bunting, in small trees growing in swampy ground

crated bishop of Constantinople in 428, who, if he did not originate, formulated in somewhat hazy language the doctrine that the B.V.M. could not be called *Theotokos*, Mother of God, because not God, but only the temple in which God dwelt, was born of Mary. In other words, he appears to have believed that in Jesus Christ there were two Persons and two Natures, that Christ's humanity was but the temple of His divinity, and that God the Son did not endure human suffering or go through human experiences. Nestorius was deposed, excommunicated, and banished to Egypt, where he died in 435. The heresy spread to Syria, Persia, India, Central Asia, and China, and communities in Iraq, Kurdistan, and Malabar, India, preserve the name but not the heresy. See Eutyches; Monophysite; Theodore; consult Nestorians and their Rituals, G. P. Badger, 1852.

**Net.** Openwork fabric of cords or threads which cross each other at right-angles and have comparatively large spaces between them. The threads or cords are knotted at their intersections; in this respect net-making differs from weaving, where the intersecting threads merely cross each other. The open spaces in a net are called meshes, and these correspond in size with the pin, which is a straight piece of wood of oval section used in net-making.

Net-making has been practised from the earliest times. Records of it have been found in the Swiss lake dwellings and in the paintings and sculptures of Assyria, Egypt, Greece, and Rome. The Chinese make fine silk nets, and the Eskimos weave nets from sinews and strips of sealskin. The chief materials now used in nets are hemp, cotton, and flax.

Fishing nets made from cotton are light, easily managed, and extremely buoyant. The majority of nets are made by machinery, the first practical loom having been invented by James Paterson in 1810. Types of fishing nets are the seine, which is thrown from a boat or the shore and then drawn back; the trawl, which is towed from a boat; the drift, which goes with the tide; and the moored net, which is stationary. Nets used in the Mediterranean tunny fishery are nearly a mile long, while those of deep-sea trawlers will bear up to 20 tons of fish.

Fly nets are used to catch birds on the seashore and clap nets for smaller birds. Very fine nets take

butterflies and other insects, and also give protection against mosquitoes. See Lace.

Wire netting, made by machinery in the same way as fabric netting, is used for fencing, and in the First Great War was put down for the surface of military roads across the Sinai desert. A heavier type in the Second Great War provided a landing surface at emergency military airfields. In wartime heavy steel netting, laid and lifted by ships specially designed for the purpose, is placed across harbour entrances and around warships at anchor to prevent torpedo attack. Steel netting, suspended from the sides of ships passing through areas liable to submarine attack, may have prevented 70 p.c. of probable sinkings in 1939-45. Quantities of fabric netting, festooned with coloured cloth, were used for camouflaging men, vehicles, and positions in the war; every British military vehicle carried sufficient netting to cover it while parked. Rope nets were fitted to transports for the rapid disembarking of men into assault craft.

**Net-ball.** Outdoor or indoor game. Although it is generally played by women, it is suitable for

Net-ball. A goal having been missed, a tussle for the ball ensues

either sex or for mixed sides. The pitch, similar in shape to a hockey pitch, usually measures 100 ft. by 50 ft., but may be varied according to the number of participants on either side, generally seven. Around the goals, which are fixed in the centre of the end lines, a semi-circle 16 ft. in radius, called the shooting circle, is drawn, and in the centre of the field a circle 4 ft. in diameter is marked, while the playing pitch is divided

into three courts of equal size by lines drawn transversely to connect with side lines.

The goals are single upright posts, each fitted with an iron ring 15 ins. in diameter, placed horizontally 10 ft. above the ground and projecting 6 ins. from the post. Attached to the ring is a net, open at the bottom, through which the ball has to be passed to score a goal. The ball is an ordinary Association football, 27 to 28 ins. in circumference. The opposing teams at the start of the game, which is played in two periods each of 15 minutes' duration, unless otherwise arranged, line up in the field, the respective positions being goal-scorer, attack, attacking centre, centre, defending centre, defence, and goal-keeper.

The game is begun by one of the two umpires, each of whom controls half the playing field, bouncing the ball in the centre circle, while the opposing centres stand outside the circle with their backs to the side lines. It proceeds when one of the centres succeeds in catching the ball, which is then batted or thrown from one player to another, until it is received by either goal-scorer or attack, standing within the shooting circle, who then attempts to shoot it into the net.

Infringements of the rules, such as offside, two players of one side holding the ball at the same time with both hands, carrying the ball, and the body foul, i.e. obstructing an opponent by interposing the body, are penalised in two ways, the first two by a free pass, and the last two by a free throw at goal, awarded to the side offended against. When the ball passes over either of the side lines, a throw-in is given against the side that caused the ball to leave the field.

In five- and seven-a-side games defending players are adjudged to be offside if they enter the attacking court, and attacking players if they enter the defending court. In nine-a-side games those players who leave their own courts are offside. The rules of the game are governed by the All England Net-ball Association.

**Netheravon.** Village of Wiltshire, England. Saxon work is seen in the tower of its 13th century church. Situated 4 m. N. of Amesbury on the edge of Salisbury Plain is a R.A.F. station which maintained fighter aircraft in the Second Great War. An infantry weapon school and machine-gun school were established, later known as the Small Arms School.

# THE NETHERLANDS AND ITS HISTORY

\* PISTER GEYL, Professor of Modern History, Utrecht

*A description of the physical features, history, and institutions of the Netherlands is followed by a separate account of happenings in that country immediately before and during the Second Great War. See also articles on the towns of Amsterdam; The Hague; Rotterdam, etc.; on the provinces, Friesland; Holland; Zealand, etc.; on famous men of Netherlands history, art, and literature: e.g. Barneveldt; Couperus; Groenewoud; Vondel; William the Silent; Witt; and the article on Dutch School. See also Indonesia*

The Netherlands is the official name of the kingdom often called Holland. That name properly belongs only to the N.W. of the country, which was the county of Holland in the Middle Ages, the prov. of Holland in the republic of the Seven United Provinces, and

Netherlands  
arms

is today organized in two provinces, N. Holland and S. Holland. The importance of this region is such that the Dutch themselves, too, in common parlance mostly extend its name to the whole country, although the words *Nederland*, *Nederlander*, *Nederlands* (the language) are always used in official or scholarly language and by more careful writers or speakers. Historically the name Netherlands, French *Pays-Bas*, Dutch *Nederlanden*, was common to the entire Low Countries, ruled over by Charles V and Philip II in the 16th century and consisting of 17 provinces, covering the area now occupied by the kingdoms of the Netherlands and Belgium and a strip of N. France.

The Netherlands, composed of eleven provinces—Friesland, N. Holland, S. Holland, Zealand, Utrecht, Groningen, Drenthe, Overijssel, Gelderland, N. Brabant, and Limburg—has an area of 13,551 sq. m., or 15,771 including gulfs and bays. It is bounded W. and N. by the North Sea, and on the E. by Germany, and on the S. by Belgium. In the S.E. corner, Limburg runs down between Germany and Belgium, assuming special strategic importance in consequence.

In the S. of Limburg is the highest point (1,050 ft.) in the Netherlands. Other outcrops of older formations occur in the E. provs., also sandy tracts 160–325 ft. high. The rest of the country, about 99 p.c. of the whole, is a comparatively recent alluvial or diluvial deposit, little of it exceeding 16 ft. above sea level, while much is below—some even 6 ft. below—sea level. This fact dominates the Netherlands in all its aspects.

Physically, the country slopes down from E. and S.E. towards the

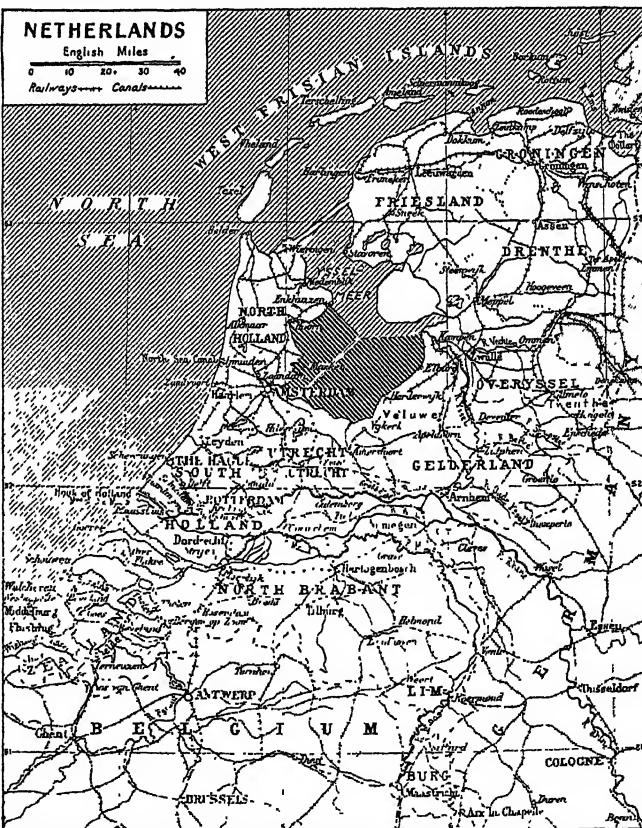

North Sea in W. and N. The sea would rush in and overwhelm this lower-lying area but for a natural protecting rim of sand-dunes, artificially strengthened. Across this area the rivers flow to the North Sea—Lek (Rhine), Maas (Meuse), Waal, Schelde being the chief—from the higher continent beyond. In the past the sea has often rushed in with devastating effect, of which visible signs are the Dollart, 1277, and the broken coastline of the Frisian, S. Holland, and Zealand islands. The former Zuyder Zee resulted from a sea invasion of 1170. At all times, too, the precarious river levels threaten internal floods.

Faced with unique problems of defence works against the waters, the Netherlands has, throughout

historical times, possessed a unique public department to cope with them, known as *Waterstaat*, or the state of the waters. The works of defence, reclamation, and drainage, directly or indirectly comprehended by the *Waterstaat*, are complicated, and for a great part invisible.

Every indyked area, of whatever size or level, the waters within which are constantly organized and controlled as a unit, is called a polder. Nearly half of the Netherlands is polderland. There are sea-polders and land-polders, and there are also *droogmakerijen*, parts where the lakes or meres formed after excavations of short peat have been drained.

Dutch peat (*turf*) is of two kinds, hard (short) and loose, according as it originates in low or high fen.

Netherlands. Map showing the waterways and canals, and the administrative divisions. The heavily shaded area is under reclamation (see text)

Some 20 p.c. of the Netherlands is fen, the greater proportion of it low, in the maritime provinces. Both kinds of peat are everywhere being removed; short peat dredged and dried from the low fens, for example, and loose peat dug off large areas, as in the famous "fen colonies" of Groningen and Drenthe. The place of both is taken by green harvests.

**LAND RECLAMATION.** The map of the country today is very different from that in earlier centuries, for while in places new lakes or meres formed, in others islands have been added to by indykings, and old lakes have been reclaimed. In the first half of the 17th century a number of lakes in N. Holland, of which the Beemster (c. 70 sq. m.) was the largest, were turned into fertile land; in the middle of the 19th century the Haarlem Lake, considerably more than twice as extensive as the Beemster. The land there reclaimed, which preserves its curiously artificial appearance, intersected by straight canals and fenced in by high dykes, is inhabited by some 29,000 people.

#### Zuyder Zee Reclamation

The reclamation of the Zuyder Zee, the great 20th century example of this kind of enterprise, was undertaken by the state in 1918. During 1920-24 a dyke was constructed connecting the island of Wieringen with the mainland (1½ m.); during 1927-33 the immensely heavy dyke, nearly 20 m. long, between Wieringen and Friesland, was built; this turned the Zuyder Zee into a lake. By 1930 the smallest of the four large polders to be constructed—an area adjoining the island of Wieringen and slightly larger than the Haarlemmermeer—had been reclaimed. When the Second Great War broke out, the N.E. polder, adjoining the mainland of Friesland, Drenthe, and Overijssel, with an area twice as large as that of the first, was dry, and during the war it began to produce wheat. A less monotonous landscape and more attractive villages have been created than in the Haarlemmermeer. The keen land hunger among the farmers' sons means there is no difficulty in peopling the new lands with an enterprising and skilled pop.

In the last hundred years the Dutch have also reclaimed enormous tracts of waste land, especially in the Veluwe (prov. of Gelderland), in the S. and E. of N. Brabant, in Drenthe, and in the S. of Groningen. Deforestation has accompanied this process in the past, but has now been checked.

Before the Second Great War the soil of the Netherlands was divided as follows: grassland, 41 p.c.; arable land, 28 p.c.; forest, 8 p.c.; horticulture, 3 p.c.; waste land, 8 p.c.; roads, land built upon, etc., 12 p.c.

**ECONOMIC DEVELOPMENT.** The pop. of the Netherlands grew from slightly over 2½ millions in 1830 to over 9 millions in 1945, an increase promoted during the 20th cent. by excellent sanitary measures—leading to the lowest infant mortality in the world—and by good housing conditions.

Before the Second Great War 38 p.c. of the pop. was employed in industry. Important industrial centres were Twente (E. Overijssel), textiles; Tilburg, textiles; Eindhoven, the great Philips firm making wireless instruments, vacuum cleaners, and other electrical apparatus, which in 1935 constituted 8 p.c. of Dutch exports; Limburg, coal mining; 20 p.c. of the pop. is engaged in agriculture (in 1900, 30 p.c.).

The Netherlands is far from self-supporting in foodstuffs, especially grain. Holdings are generally small, cultivation is intensive and on a high technical level. Important for exports are dairy produce, especially from Friesland and N. and S. Holland, fruit, vegetables, and flowers, e.g. from the Westland (S. of The Hague) and the region between Haarlem and Leyden.

In the 1930s exports were 65 p.c. of imports, the difference being made good by shipping and trading and by investments abroad. Dutch economy, based on expert and technical skill and on international relations, was highly vulnerable and subject to international fluctuations, and in 1939 the number of unemployed rose to 500,000.

#### Post-war Economic Conditions

Damage suffered during the German occupation, 1940-45, as a result of deliberate destruction and plunder, was estimated at 11.4 milliards of guilders, i.e. 32.6 p.c. of the pre-war national wealth. The post-war economic situation was serious. Export to Germany, before the war the principal market for vegetables and dairy produce, had virtually ceased. The troubles in Indonesia, from which before the war 14 p.c. of the national income was derived, were another drag on recovery. A large part of investments abroad had been lost.

Drastic monetary measures in 1945 prevented inflation; a careful system of rationing of food and textiles (ended in 1949),

respected by the Dutch with comparatively little evasion, reduced inequalities between citizens. In 1946 only 37 p.c. of imports were covered by exports; in 1948, 54.2 p.c.

Closer economic cooperation with Belgium and Luxembourg (see Benelux in N.V.); the dollars the Netherlands received from 1948 under Marshall aid (see European Recovery Programme in N.V.), and the end of war in Indonesia (*q.v.*) were factors in her steadily improving situation.

**PEOPLE, LANGUAGE, LITERATURE.** This strange and relatively new country holds a pop. of (est.) 9,295,304. It is densest in N. and S. Holland, where are the largest cities. Nederlanders are, in the main, Frisian, Saxon, and Frank, much intermingled, but still clearly showing the several types. Frisians, solid in Friesland, have mixed with Franks in the W. maritime provinces, and in a less degree with Saxons in Groningen; otherwise, broadly, the S., W., and centre are Frankish, the E. Saxon. All three have a language in common, within which dialects vary. A distinct Teutonic tongue, it stands between English and German. Frisian, also a distinct Teutonic tongue, has a literature of its own, though it is spoken only in the countryside of Friesland.

#### Dutch and Flemish

The Dutch language (*Nederlands*) extends over the N. half of Belgium, where it is commonly called Flemish, although *Nederlands* is there, too, the official description. In the Middle Ages and 16th century the active centres of Netherlands civilization and literature were to be found there, in Ghent, Brussels, Antwerp, etc. It was only after the split brought about by the war of independence against Spain that the lead was transferred to the N. Many Flemish refugees from the provinces reconquered by Spain took an important part in the outburst of intellectual and artistic activity characteristic of the first century of Dutch independence.

As in painting, so in letters, the 17th century was the golden age of the Netherlands, with the historian Pieter Corneliszoon Hooft (1581-1647), the comic playwright Gerbrand Adriaanszoon Brederoo (1585-1618), and the great Joost van den Vondel (1587-1679) as its shining figures; besides whom stands the homely fabulist, Jacob Cats (1577-1660), popularly most influential at home and best known abroad. Willem Bilderdijk

(1756-1831) offered determined and impassioned resistance to the spirit of his age; a reactionary in his own day, he was later to be acclaimed the forerunner of the Calvinistic revival. The poets Christiaan Starling (1767-1840), Hendrik Tollens (1780-1856), and Pieter Augustus de Genestet (1803-61) were his contemporaries.

A magazine, *De Gids*, founded early in the 19th century, was an inciting force to a revival of letters; its great figure was Everhard Johannes Potgieter (1808-75), who believed in the resuscitation of the people by the modern liberal spirit as well as by the example of the glorious past. Later on he was assisted by Conrad Busken Huet (1826-86), who tried to raise the level of literature by a merciless comparison with literature abroad. Even more in opposition to the prevailing self-complacent mediocrity was the romantic and revolutionary Eduard Douwes Dekker (*q.v.*, 1820-87).

#### Influence of *Nieuwe Gids*

The *Nieuwe Gids* group—with whom the pioneer of the modern lyric, Jacques Perk (1859-81) was one in spirit—included the poet and critic Willem Kloos (1859-1938), and the pioneer writer of the naturalistic novel, K. J. L. Alberdingk Thijm ("Lodewijk van Deyssel," b. 1864). With its claim for art as the most individual expression of the most individual emotions, it has since inspired many movements and reactions. Albert Verwey (1865-1937), originally a member of the group, became a leader into quite different directions of philosophic reflection and social sense. The brilliant novelist Louis Couperus (1863-1923), the realistic dramatist Herman Heyermans (1864-1924), the idealistic poet Frederik van Eeden (1860-1932), who became an R.C., Herman Gorter (1864-1927), the poet who wrote *Mei*, immortal idyll of Dutch nature, and became a Marxist, the mystical poet P. C. Boutens (1870-1943), and the poetess of socialism and humanitarianism Henriette van der Schalk (b. 1869, married to the painter Roland Holst), were all, diverse as they are, stimulated by the *Nieuwe Gids*.

The movement coincided with a marked economic revival, and the mental activity, absence of which was so bitterly deplored by the great mid-19th century critics, has not since flagged in Holland, and extended into Flemish Belgium, where the priest Guido Gezelle (1830-99) had already written

religious and nature poems, and where now came August Vermeylen (1872-1945), an essayist of great intellectual force; and the great poet, a combination of sensuality and intellectualism, Karel van de Woestijne (1878-1930). Stijn Streuvels (1871-1945) depicted Flemish peasant life in his novels, while Felix Timmermans (1890-1946), the creator of the exuberant *Pallister*, was enthusiastically read in both Holland and Flanders.

Herman Teirlinck (b. 1872) was a versatile novelist and playwright. In Dutch litera-

peared for the most part under new names. The great organs of the cultivated classes, the *Algemeen Handelsblad* of Amsterdam (conservative liberal), and the *Nieuwe Rotterdamse Courant* (progressive) survived. The Socialist newspaper is *Het Vrije Volk*, the Anti-Revolutionary paper is *Trouw* (formerly *De Standaard*); *De Nieuwe Nederlander* is the organ of progressive, even Socialist, Protestant opinion, while the R.C.s have *De Tijd* and *De Volkskrant*. The majority of readers of Dutch newspapers are postal subscribers, a fact which consolidates the authority of newspapers as organs of political opinion.

Bearing significantly on the literature, art, and culture generally of the Netherlands is the fact that its language is little known beyond its own frontiers. As a result an unusually large number of its inhabitants speak, read, write, and even become authors in foreign tongues. Hence the exotic influences manifest in native literature and art, and a tendency to run after strange gods in both.

ture proper the most remarkable novelist of the period was Arthur van Schendel (1875-1946). Martinus Nijhoff (b. 1894), a poet of playful

sensitiveness, A. Roland Holst (b. 1888), a poet of nostalgic and apocalyptic imaginativeness, took little part in the battle of ideas. H. Marsman (1899-1940), the "vitalist" poet and critic, was drowned while trying to escape from France to England; the brilliant and mercilessly critical essayist Menno ter Braak (1902-1940) committed suicide when the Germans entered Holland. Slightly older than any of these, but flowering in poetry generally regarded as great only in the 1940s, was P. N. van Eyck (b. 1887), whose work is marked by a strong philosophic and mystical strain.

The press of the Netherlands was strongly affected by the Second Great War. Of the underground papers which tried to maintain themselves and take the place of organs suppressed because they had continued to appear under German control, the one of importance is the *Parool* of Amsterdam, the *Telegraaf* having been suppressed. Party papers reap-

Netherlands. Types from the southern provinces of the Netherlands. 1. A Zeeland village schoolmaster. 2. Unmarried girls from Zeeland. 3 and 4. Old Gelderland peasants

**EDUCATION.** Education is increasingly practical, and gains much from a zealous public interest. Attendance at school has been compulsory since 1900; the obligatory age is 6 to 13, and there is careful provision for continuation classes. Primary education is free where necessary. An eighth school year introduced just before the Second Great War had to be suspended owing to lack of room in the schools and of teaching staff

Education was the great bone of contention between the Liberals and the Protestant and R.C. parties during the second half of the 19th century. The state schools, which originated from the education law of 1806, were intended for all denominations, and any religious teaching that might offend the susceptibilities of any of the Christian sects or of the Jews was therefore barred. The confessional parties strove to obtain, first the liberty to found denominational schools of their own, next a state subsidy to maintain them. In 1918 at last, by agreement among all parties, Liberals and Socialists gave way to a claim which was founded on conscience, while Protestants and R.C.s abandoned their opposition to universal suffrage, and the constitution was revised accordingly.

Denominational schools are managed by their own boards which appoint the staff; they are supported completely by public finance and are subject to state inspection as to efficiency; teachers must be in possession of the qualifications prescribed by the state. The state schools, which at one time had a monopoly, now accommodate less than half the pupils in the country.

#### Higher Education

Intermediate education is given in professional, technical, trade, commercial, and industrial schools, and schools for special local and industrial needs. In the high (Higher Burgher) schools co-education is general.

When founded in 1863 the Higher Burgher schools with a five-years' course were not intended to prepare pupils for the universities. In the early part of the 20th century, however, it was arranged that their final diploma should admit to the faculties of science and of medicine, and today more than half the university students in those faculties come from the Higher Burgher schools. The certificate of the old-established gymnasium, or grammar school, found in all towns of any importance and having a curriculum with many hours devoted to Latin and Greek, is still required for entry to the faculties of law, theology, and literature.

The state universities of Leyden, founded in 1575, Groningen, and Utrecht, and the municipal university of Amsterdam, which dates from 1875, have faculties of law, medicine, theology, science and mathematics, literature, and philosophy. Utrecht has also a veter-

inary faculty. At Amsterdam there is also a Calvinist university and at Nijmegen an R.C. one.

The technical school at Delft now enjoys university status, as does the agricultural school at Wageningen.

**CONSTITUTION AND GOVERNMENT.** The constitution of the Netherlands has not grown gradually like that of England. During the French period (1795-1815) there was a radical breach with the federal and also with the oligarchic system of the republic. The first constitution of the independent kingdom (1814) retained centralisation, and assigned large powers to the sovereign. The most important revision was that of 1848, when parl. gov. may be said to have been introduced, while prov. and municipalities were given a larger measure of autonomy.

The sovereign, whose person is inviolable, is head of army and navy; the executive power is his. There exists, to advise the crown, a resuscitated historic body, the council of state (*Raad van State*); it has the influence of its individual members, but cannot interfere directly with government. It has some slight judicial powers, but its authority is confined to emergency. Another nominal link between the Netherlands present and past is the provincial states, now, except in respect of defence against river and sea, a purely administrative body. It is popularly elected, but not for political ends, although it, in turn, elects the senators.

#### The States General

Real legislative authority lies with the states general. It comprises two chambers, the first with 50 members, the second with 100. Members of the first, or senators, are elected by the provincial states, on special qualifications, for nine years, one-third retiring every third year. Expenses are allowed them, £2 per day, during session. Their function is to advise or control, not to initiate, legislation.

The 100 deputies in the chamber, as the second is generally known, are (under the Reform Act, 1919) elected for four years by the votes of all citizens of both sexes who have reached 23, on a system of proportional representation. Deputies are paid £500 annually in addition to expenses.

The chambers of the states general meet separately in the historic Binnenhof in The Hague, each under a president appointed by the crown on the nomination of the chamber itself, except for

joint opening and closing sessions, or when specially called together by crisis. The sovereign can dissolve either chamber, or both, at will; a new chamber must be formed within 40 days.

The permanent administration of the provs. is in the hands of a commissioner appointed by the crown assisted by a committee of deputies chosen by the provincial states from among themselves.

In each of the 1,110 communes there is a popularly elected council, which chooses aldermen (*Wethouders*) from its own number. They, with a burgomaster appointed by the sovereign, form the daily executive authority, with control over the communal police.

**DEFENCE.** Service in the army is partly compulsory, partly voluntary. Conscripts are chosen by lot. Total war strength could be raised to 500,000 men (1940). Inundation in "Holland's Fortress" round the citadel of Amsterdam plays a large rôle in the scheme of defence, even though in the Second Great War it was made useless by surprise air tactics (see Netherlands: Second Great War). Her armed forces were integrated with those of other Western Union powers in conformity with the defence plans developed under the North Atlantic treaty, 1949.

**JUSTICE.** Courts of justice comprise cantonal (100), district (23), appeal (5), and the high court at The Hague, the judges being appointed by the sovereign for life. Civil and criminal cases are tried in all courts. Dutch law has developed from the *Code Napoléon*.

**HISTORY.** More than one date may be given for the beginning of the Netherlands as a nation. The struggle for liberty of conscience and freedom from unjust levies had been going on already for 15 years when, on July 29, 1581, Holland, Zealand, Utrecht, Gelderland, Brabant, Flanders, and Overijssel formally abjured the sovereignty of Spain. These United Provinces were not recognized by Spain until the treaty of Westphalia, Jan. 30, 1648, by which time Groningen and Drenthe had been included in the confederacy, and Spain had reconquered most of Brabant and Flanders. The period just defined is that of the war of independence.

The great figure in this drama of creating a new power and a new kind of power in Europe was William the Silent, prince of Orange. When he appeared upon the scene, a youth at the court of Charles V, all the provs., both N.

and S., had emerged from a state of flux, under their several counts and bishops, as possessions or fiefs of the Spanish crown, inherited from Burgundy and Austria. Orange, embracing Protestantism, headed the revolt in them against the folly and fanaticism of Philip II and his agents, Alva in particular. Then followed the capture of Brill in 1572 by the "beggars of the sea," the sieges of Haarlem, Alkmaar, and Leyden, and other incidents of the struggle picturesquely, though not always accurately, described by Motley.

After the assassination, in 1584, of Orange, the fight was continued by his two sons as stadtholders: Maurice (1567-1625), the born soldier, and the politically wiser Frederick Henry (1584-1647). The N. provs. issued from it as the powerful Dutch republic — the Netherlands of today. The S. provs. remained the Spanish Netherlands, to become some 200 years later Belgium.

The power of the new republic was a fact long before its enemies acknowledged it. For it the 80 years of war were a period of unparalleled advance, in the empire of the sea, the expansion of commerce, the exploitation of trade and industries, and the arts of peace. The Dutch East India co. was founded in 1602, the West India co. in 1621. In 1609 was established the bank of Amsterdam, pre-eminent among such institutions. With the opening of the 17th century the Netherlands had already passed into its golden age.

#### Dissension and Jealousy

But there was present in it a canker of religious and political dissension which ate into the rich body. The jealousies of the provs. one of another were complicated by those of the towns. There were rival parties of union and secession, fierce contentions for peace and state rights as against war and central government. The quarrel between Maurice and John van Oldenbarnevelt, resulting in the execution of the latter (1619), was significant of the strain of opposing forces which had weakened the republic from the first, and were to cause its fall. The Netherlands, by the immense effort of its earliest days, was left like a boy who has outgrown his strength. Next to its unique physical conditions, this "fatal flaw" in its constitution is the most significant fact in Netherlands history.

In 1641 Frederick Henry's son, William, married Mary, daughter of Charles I of England. This

alliance consolidated the authority of the Orange family, and entangled the United Provinces in the meshes of foreign politics. During the minority of the third stadtholder, William, commercial rivalry involved the republic in the first naval war with England (1652-54).

The third William's troublous minority saw further naval wars, in one of which De Ruyter entered the Thames in 1667, and the formation of the triple alliance between England, the United Provinces, and Sweden. But the prince's tutor, the grand pensionary John de Witt, could not prevent a disastrous renewal of war with France, and he and his brother Cornelis were murdered at The Hague by an Orangist mob. Thereupon (1672) William was declared stadtholder. He proved a great general, and 1697 brought the peace of Ryswick. Meanwhile, in 1677, he had married Mary, daughter of James II of England; in 1689 he, with his wife, mounted his father-in-law's throne, and until his death in 1702 he was both William III of England and the third stadtholder of that name.

#### End of the Stadtholderate

The 18th century was for the Netherlands a period of steady decline. In the war of the Spanish succession (1702-13) the United Provinces shared Marlborough's victories, but were exhausted in the effort. An interregnum in the stadtholdership after the third William's death was followed in 1747 by the election of a cousin, and this fourth William married George II's daughter Anne. The peace of Aix-la-Chapelle (1748) left the Netherlands at a very low ebb. After eight years' regency of the widowed Anne (1751-59) her son William was appointed stadtholder. The old feud of the states against the united power which the stadtholder symbolised was resumed by the patriot party, which, following the French Revolution, welcomed the French in their country (1795). William, fifth and last of the stadtholders, thereupon fled to England.

The period following (1795-1813) was one of French domination. Its successive stages were recognition of independence to 1805; dictatorship of Napoleon through the grand pensionary, Rutger Jan Schimmelpenninck, 1805-06; Louis Napoleon's reign as king of an independent Netherlands, 1806-10; annexation by France, 1810-13. In 1813, after Leipzig, G. K. van Hogendorp established a provisional govern-

ment, which recalled the prince of Orange (the fifth William's son) not as stadtholder, but as sovereign. Thus the modern kingdom of the Netherlands came into existence.

After a brief reunion (1815-30) of the former Spanish Netherlands, the southern part rebelled and was in 1839 recognized by the powers as a separate country, Belgium. William I abdicated in 1840 in favour of his son, William II, who reigned until 1849. His son and successor, William III, lived until 1890, after which the queen-dowager, Emma of Waldeck Pymont, acted as regent until her daughter, Wilhelmina (b. 1880), ascended the throne in 1898. Wilhelmina married in 1901 Henry of Mecklenburg; their only child, Juliana (b. 1909), ascended the throne 1948 on Wilhelmina's abdication. By her husband Bernhard of Lippe-Biesterfeld, Prince of the Netherlands, (m. 1937) she had four daughters, Beatrix (b. 1938), heir presumptive, Irene, Margriet, and Maria.

**POLITICAL LOYALTIES.** Chiefly as a result of the struggle over the schools (see under Education), religion from the middle of the 19th cent. was the basis of Dutch party politics. The revised constitution of 1848 opened an era in which, under direct suffrage, the Liberals were in the ascendant. The R.C.s owed their emancipation in 1795 to the current of thought represented by Liberalism; while the reintroduction of the R.C. hierarchy in 1853 was directly due to the new constitution, and the Liberal ministry under Thorbecke (1798-1872) was driven from power for a while by an outburst of Protestant resentment. Soon, however, the R.C.s began to waver in their support of the Liberals.

#### Nineteenth Century Politics

At the same time, from the old Conservative party there detached itself a group of strict Calvinists, whose numerical strength was, until the suffrage was extended, "behind the electorate," among the lower middle class and peasantry, but who were led by a remarkable thinker, Groen van Prinsterer (1801-1876), and by landed aristocrats. This orthodox Protestant party, which gradually replaced the Conservative party, soon split in two: the Anti-Revolutionary party, composed mainly of members of the *Gereformeerde Kerk*, formed by orthodox secessions, 1834 and 1886, from the *Hervormde Kerk*, and the Christian Historical party, composed mainly of orthodox members of the

*Hevormde Kerk*, which in republican days had been the state church.

The school question led to the at first sight somewhat surprising coalition between the R.C.s and the two Protestant parties, of which Dr. Kuyper (1837-1920), the leader of the Anti-Revolutionaries, and the R.C. leader, the priest Schaepman (1844-1903), were the principal authors. Under Dr. Kuyper's premiership, 1901-1905, the tension between the "Christian" parties and the "paganists" ran high. When the school question was settled in accordance with the wishes of the confessional parties (1918), it was expected that cooperation between R.C.s and Calvinists would not last much longer. A Socialist party (founded 1894) was now an important element in the situation, and the R.C. party embraced progressive forces which seemed to make a re-alignment easy.

Social legislation, with which the last Liberal government of 1897-1901 had made a beginning, was now the great problem. Relations between the R.C.s and the two Protestant parties showed signs of strain; yet virtually the entire period between the two wars was filled by cabinets composed from among the three parties of the right. It was not until 1939 that a definite breach occurred between Dr. Colijn, the strongest statesman of those years, an Anti-Revolutionary of marked conservative leanings, and the R.C.s, whereupon a ministry was formed by a Christian Historical elder statesman, Jonkheer de Geer, into which, apart from R.C.s and others, Socialists entered for the first time. It was this cabinet which in 1940 took refuge in England (*see Netherlands: Second Great War*).

#### Post-War Developments

Of 51,012 persons arrested and charged with collaboration and other wartime crimes, Anton Mussert, made *Fuehrer* of the Netherlands by Hitler in 1942, and Max Blokzijl, who broadcast German propaganda from Hilversum, were executed on May 7 and March 15, 1946—the first executions in the Netherlands for 92 years. De Geer, who, after accompanying the govt. to London in May, 1940, returned without permission to the Netherlands in the following Sept., was found guilty of high treason in time of war and sentenced May 23, 1947, to a year's imprisonment and three years' probation.

During the war many entertained hopes that the sense of national unity promoted by the

German invasion would survive and break down the religious divisions dominating Dutch politics; and the first post-war cabinet was formed by Willem Schermerhorn, a resistance leader who was a strong advocate of a party without religious affiliations, supported by Willem Drees, another resistance leader and a Socialist. But general elections held in 1946 showed that the old divisions remained. The R.C. party, with 32 (out of 100) members, won most seats, and L. J. M. Beel, its leader, became prime minister, Drees, with 29, remaining in the cabinet.

New elections in 1948 gave the R.C.s again 32 seats, the Labour party 27, the rest being distributed as before among half a dozen other parties. By this time policy in Indonesia was another source of division; and Juliana insisted that the new cabinet should be broadly representative of the nation, in-

stead of a coalition of two parties only. After some difficulty, such a cabinet, led by Drees, was formed. It immediately drew up a bill, passed by the states-general in Sept., amending the constitution so that the Netherlands-Indonesian union could be set up; and in 1949, under United Nations pressure, carried into effect a settlement with Indonesia (*q.v.*).

The Netherlands was a party to the treaty of Brussels, 1948, and shared in later defence and other measures (*see Western Union*).

## NETHERLANDS: SECOND GREAT WAR

F. S. Gerbrandy, Prime Minister of the Netherlands, 1940-45

*Prof. Gerbrandy tells vividly the history of the fighting in May, 1940, and of the resistance and sufferings of the Dutch people during the German occupation. For the fighting in the liberation of the south, see Europe, Liberation of; Schelde; Walcheren, etc.*

On May 26, 1937, the last pre-war elections for the second chamber of the states general were held. They proved a success for the leader of the Anti-Revolutionary party, Dr. Colijn, who formed a right-wing cabinet which continued in office until July 24, 1939.

A cabinet of the right meant one supported by the confessional parties, viz. the Anti-Revolutionary party, the Christian Historical union, the R.C. party, all of them with principles and programmes based on the foundation of a religious outlook on life.

A proposal, already accepted by the old chamber, to empower the govt. to take measures against extremist political parties (some thought of the Communists, some of the National Socialists) did not gain the majority of two-thirds of the votes cast as required by the constitution.

Internal division brought about the overthrow of the Colijn cabinet. It was succeeded by another Colijn cabinet, without a parl. majority, which gave way after a few days, and was followed on August 10, by a coalition cabinet formed by de Geer in which all the principal Dutch political currents were represented. The author of this article held a seat in that cabinet as an Anti-Revolutionary, without, however, the official

mandate of his party. Shortly after this cabinet came into office, the Second Great War broke out. The Netherlands was again confronted with the problem whether it should remain neutral or take sides. After the League of Nations lost all authority, Dutch foreign policy had tended towards neutrality (the policy of independence). A sudden change of direction was impossible. During a debate in the first chamber of the states general, the govt. as well as members of the chamber, including one of the most prominent, Professor Anema, asserted that to take sides was not imperative. At the same time, people as well as govt. were convinced that in the conflict already looming up, the Netherlands could not but side with Great Britain and France. The govt. made every effort to avoid even the semblance of being provoked by the Germans, but the German invasion, acutely imminent on Nov. 11, 1939, became reality on May 10, 1940.

The invasion had been prepared by fifth columnists, most of whom were non-naturalised Germans exercising their profession or carrying on their trade in the Netherlands; others were Dutchmen, members of the Dutch National Socialist party. For example, a house in The Hague

close to that of the writer proved on May 10 to conceal liaison agents of the Germans, arms, and wireless transmitting and receiving apparatus, which had escaped the keenly vigilant eye of police and secret service. In other places Germanophile persons rendered assistance to parachutists in accordance with instructions given in advance by the Germans. Disloyal elements proved to possess weapons, which they immediately brought to bear against Dutch troops. As a result certain points within The Hague became centres of hand-to-hand fighting between Germans and their collaborators and Dutch soldiers. The same thing happened elsewhere, e.g. in Rotterdam.

Diep near Moerdijk connects the E. and S. of the country with the territory within the so-called "waterline" (which checked Louis XIV in 1672); among all the bridges destined to be blown

both with German ground troops and with parachutists dropped to occupy airfields within the waterline. But neither the capture of Moerdijk rly. bridge nor the early loss of airfields within the water-

Netherlands. Scenes during the Second Great War. 1. Result of the overwhelming air bombing of Rotterdam, May 14, 1940, in which the heart of the city was demolished. The Groote Kerk alone stands up among the ruins. 2. Wieringerwerf (built on land reclaimed from the Zuider Zee), where the waters rose 20 ft. through the cutting of the dyke by the Nazis. 3. Victory parade in Utrecht, May 7, 1945, menaced by concealed Nazis who opened fire

Photo 1, *The Times*

Although the number of Germans in the Netherlands was far more than 100,000 (there was a considerable exchange of nationals between Holland and Germany as a result of years of commercial intercourse), the fifth column was small; its activities none the less were intensive. In several instances Dutch members of the National Socialist movement appeared wearing German uniforms. In the W. of the country the long rly. bridge over the Hollands

up, this was the main one. German parachutists were dropped there very early in the morning, and frustrated the blowing up of this approach to the heart of Holland. Consequently the cities of Dordrecht, Rotterdam, Delft, The Hague, situated within the waterbound area, became unprotected from the moment the enemy succeeded in breaking resistance in the S.E., and very soon after the invasion from the E. fighting occurred within the "waterline,"

line was the decisive factor in the development, which, except in the S.W. of the country, where resistance was kept up for another week, led to collapse after five days' fighting; for within the waterline resistance against the advancing Germans coming across the Moerdijk bridge continued to the end and the airfields lost on the first day were, except one (Waalhaven, near Rotterdam), recovered by Dutch troops within 24 hrs. The decisive factors were German superiority in the air, the German break through the Grebbe line, the bombing of Rotterdam. Despite desperate efforts during the year and a half preceding the outbreak of war, the Netherlands had not been able to bring its air force up to strength. Holland possessed about 200 aeroplanes, and those did exceedingly well—in two days, together with A.A. artillery, they shot down more than 180 German planes—but after that the air battle was over. To the E., before the waterline proper, lies a second waterline including a part (near the Grebbeberg) lying above inundation level. The Grebbe line had originally been intended as a second line of defence (after the Yssel line farther E.), the waterline proper being the third. German strategy forced the Grebbe line to function as the definite line of resistance. Furious battles took place there, thousands of Germans being killed, but their onslaught proved irresistible. Nor did the Germans succeed in

forcing the dyke shutting off from the sea the former Zuider Zee.

The bombing of Rotterdam, which reduced acres of the heart of the city to ashes, proved that Holland's big cities were bound to be destroyed if the battle were continued, on account of the smallness of the country.

On Whit Sunday, May 12, 1940, the cabinet warned the queen that the moment was approaching when a move from The Hague must be made. Very early in the morning of the 13th, Gen. Winkelman, c.-in-c. of land and sea forces, indicated that the departure from The Hague of the queen and the cabinet was inevitable that very day. Before the morning was over, the queen left for The Hook, where two British destroyers lay ready at need to convey to England the queen, the ministers, the British ambassador, the chief civil officials, and other prominent persons. The cabinet left for The Hook of Holland in the afternoon. Their route ran through territory which was already the scene of skirmishes with the enemy. The queen had departed in the first destroyer, after being subjected to a bombing-attack; in the evening of that day, the cabinet followed, the minister of War having advised them to wait no longer. The plan to go to the S.W. of the country, where resistance could be protracted, had to be abandoned. That the queen did not leave too early is indicated by the fact that she arrived in London at the moment that Rotterdam, of which The Hook is the coastal port, was being bombed. German parachutists had already tried to take the royal palace at The Hague. Later documents have shown that the Germans intended if possible to capture the royal family and the ministers of foreign affairs and of justice.

#### German Brutality

After the capitulation came the German occupation. In its full depth the nature of the occupation can be felt and described only by one who has actually endured it. During the occupation 105,000 Dutch Jews were murdered, more than 2,000 people of the resistance movement were executed, many more were tortured; between 10,000 and 20,000 Dutch died in concentration camps in Germany, more than 4,000 in the Netherlands; 25,000 to 30,000 Dutch civilians were starved to death, 90,000 Dutch people are still missing; enormous

stretches of grass and arable land were damaged by deliberate inundation with salt or fresh water; 380,000 young men, of whom 33,000 did not return, were transported to Germany to work for the German war machine, many of them dragged away like cattle; thousands of millions of capital were stolen, certain parts of cities (e.g. part of the S.W. of The Hague) were pulled down without reason; valuables worth millions were transported to Germany, countless factories were dismantled and transferred to Germany, as a result of which the lack of machinery after the liberation was worse than in any other country of Europe.

#### Manifestations of Resistance

Resistance started on May 15, 1940, the day on which the Germans had conquered the whole of the country. It was thus instantaneous. It had many aspects, according to the circle within which it manifested itself. The churches resisted by proclamations, made by a particular body or in common by all, and read from the pulpit all over the country on the same day. The proclamations on the pogroms and the deportation of Dutch civilians were particularly moving.

The schools, notably the denominational schools, insisted on maintaining their right to determine the nature of the school programme, to appoint and discharge the teachers, to maintain the national character of the education they gave. Like the clergy, many teachers paid for that battle with their lives. The physicians developed so massive a resistance that the Germans had to give in; the protest made by this group when in Nov., 1944, young men were dragged away from Rotterdam and elsewhere as slave labour is another moving document against the oppressor.

750 illegal papers were published; at first they were cyclostyled, later printed. The best known, e.g. *Vrij Nederland*, *het Parool*, *Trouw*, several of them with hundreds of thousands of readers, continued to appear after liberation though the unity which characterised them during the occupation soon disappeared.

The principal resistance organizations were (1) *The Ordedienst* or O.D. (order service) which was under military discipline, had a special character in each province, and aimed in particular at having ready an organization to maintain order at the moment

of the liberation. In the autumn of 1944 the local O.D. at Middelburg intimated to the advancing British troops through its well-organized telephone and radio service that, although they had abandoned the scheme, they could occupy the town, all treacherous elements having been locked up.

(2) *The Landelijke Organisatie voor Hulp aan Onderduikers* or L.O. (rural organization to help "divers") which provided safe accommodation and sustenance for one million civilians who had risked their lives out of a total of nine millions in a country where the Germans controlled the entire rationing machinery. The gossamer network of organization, the devotion, the minute falsifications involved in this work in the small, flat, densely populated Netherlands, can scarcely be imagined. The primary aim of this organization entailed all sorts of other tasks.

(3) *The Knokploegen* (K.P.) (knuckles gangs) which charged themselves with the liberation of arrested people, the destruction of population registers, etc. One left-wing group burned the Amsterdam population register, which upset German plans for deporting slave labour on the basis of this meticulous record.

(4) *The Raad van Verzet* (council of resistance), which formed an integral part of the Netherlands military forces of the interior, when these were formed.

#### Seyss-Inquart as Ruler

The K.P. gangs, always willing to venture upon the most dangerous undertakings, reflected the relentless resolution of the whole resistance. One relatively small group centred upon an illegal paper saw 170 of its members executed. In many cases the bonds between those who survived remained as strong as ever, and this spirit of the resistance, with its notable element of spiritual combat against the oppressor, found its way in many guises into post-war literature.

The Germans pretended that the Dutch were a somewhat neglected part of the great German nation, and they took measures in the Netherlands which were taken neither in Belgium nor in France. The Netherlands came not only under military, but also under civil administration, which was placed in the hands of Seyss-Inquart, one of the most abominable but most able of the Nazi leaders. At first he tried to win the people, but as he did not

succeed, he took measures gradually increasing in mad severity. The Germans wanted to make it clear to the Dutch people that if they did not wish to be what they were, *i.e.* part of Germany, they were destined totally to disappear. Documents discovered after the war prove the Germans' intention to transfer most of the Netherlands population to the E. of Europe.

The suffering of everyone was intense. Indescribable misery in the form of starvation was caused during the winter of 1944-45, especially for those who lived in the N.W., which remained unliberated to the last moment. This winter will be recorded in history as an unprecedented calamity. Thousands on the brink of starvation roved *e.g.* from Amsterdam to Wieringermeer, from places in the S. right across the country to the E.; some saw the food they had collected from the farms looted by the oppressor at the very last moment, some never returned. Other countries of the world know calamities as great. But this catastrophe befell a land that until shortly before the war had lived in comparative luxury, and it was caused by the deliberate act of the German oppressor, who took vengeance for the general strike of all railwaymen in the Netherlands which began on Sept. 17, 1944, at the suggestion of the exiled government in London. The railwaymen did not return to work until the oppressor had capitulated.

An Allied attack from the S. towards the North Sea must, it was decided, be made only in extreme emergency, as it might result in the total destruction of the most thickly populated, most highly industrialised and prosperous part of the country which includes the cities of Amsterdam, Alkmaar, The Hague, Rotterdam, Utrecht, Haarlem, Leyden, and Delft. Deputies of the underground movement and the Netherlands government in London agreed to call on the British government to come to the aid of the starving people. Strong action taken by Winston Churchill after consultation with President Truman led to the charging of Gen. Eisenhower with the order to compel the German occupation forces not to resist relief work. The dropping of food parcels by the R.A.F. in the stricken area began on April 29, 1945.

On Sept. 3, 1940, the de Geer cabinet which arrived in London

Netley, Hampshire. Courtyard and main entrance to the Royal Victoria Military Hospital  
Orlbb, Southsea

on May 14 was replaced by the Gerbrandy cabinet, whose task was to continue the battle alongside the Allies outside the mother country, and to take up and maintain contact with the people of the conquered territories. After inaugurating battle in the Pacific with the declaration of war on Japan on Dec. 7, 1941, this cabinet continued in office until Feb. 24, 1945. A second Gerbrandy cabinet, coming into office immediately, included several persons from the liberated S. of the country, and after the German capitulation and the liberation of the whole country, May 5, transferred the seat of government once more to the Netherlands.

On June 23, six weeks later, the Gerbrandy cabinet, in conformity with its intention expressed long before, resigned. *See further Netherlands*, p. 6022.

**Netherlands Antilles.** Name adopted in 1948 for the overseas territory of the Netherlands formerly called Netherlands West Indies or Curaçao (*q.v.*).

**Netherlands East Indies.** Former name of the Netherlands possessions in the E. Indies, called since 1946 Indonesia (*q.v.*).

**Netherlands West Indies.** Collective name for the Netherlands Antilles (*see Curaçao*) and Surinam (*q.v.*).

**Nether Stowey.** Village of Somerset, England. Situated 9 m. W. of Bridgwater, it was 1796-98 the residence of S. T. Coleridge.

**Néthou, Pic de** (Sp. Aneto). Mountain peak of the Central Pyrenees, in the Maladetta group, between France and Spain; highest point of the range: 11,168 ft.

**Netley.** Village of Hampshire, England. It stands on the side of Southampton Water, 3 m. S.E. of Southampton, with a rly. station. Here are the extensive ruins of a Cistercian abbey, founded about

1239. In 1856 a military hospital, the Royal Victoria, was begun at Netley. It was opened in 1863 and became the largest on the peace-time establishment of the R.A.M.C. It has accommodation for 1,100 patients, and trains personnel of the army medical services. In the First Great War, it was used for Australian

forces based in Great Britain, and during 1943-45 it was occupied by U.S. army medical services. Pop. 1,500.

**Net Personalty.** Legal term to denote the total personal or movable property left by a testator, less any charges for debts which may lie against the estate. Personal property is defined as consisting of such items as money or goods, and such rights and profits as relate to these. Real property, which is distinct from net personalty, consists of land and buildings which are immovable.

**Net Price.** Term to denote the real price, not the nominal price without discounts, of an article. The net book agreement of 1899, still in operation, was the result of a move by publishers and booksellers to stop the practice of underselling then prevalent in sections of the book trade. "Net Books" are published at net prices and supplied to the retailer on condition that they are not sold to the public at less than that price within a specified period.

**Netsuké** (Jap., attached root). Toggle or button on a Japanese kimono. The kimono has no pockets, and the netsuké is used to attach a cord from which is suspended the wearer's writing-case, purse, and keys. The original netsukés were of carved cherry wood, but later ivory, coral, agate, marble, jade, ebony, amber and metal were used. On account of their elaborate carving—usually illustrating figures, animals, and fairy-tales—netsukés are collected by Europeans. A fake can be detected by its sharp edges, which would not be suitable for actual use, and the absence of wear at the sides of the holes.

**Nettle** (*Urtica dioica*). Perennial herb of the family Urticaceae. It is a native of the N. temperate

regions, S. Africa, and the Andes. The creeping rootstock sends out runners, soon forming a large colony. The oval or lance-shaped, opposite leaves are downy and well furnished with stinging hairs; the edges strongly toothed. The flowers are small and green, the males being in separate, looser clusters than the females. A smaller annual species (*U. urens*) has smooth leaves with stinging hairs, and the clusters few-flowered. Another annual is the Roman nettle (*U. pilulifera*), a coarser-looking plant, whose leaves, save for the stinging hairs, are also smooth. The Australian tree nettle (*U. gigas*) grows to a height of 100 ft. or more. Nettle-shoots in spring make a valuable pot-herb, and a green dye is obtained from the leaves. Several species of nettle are employed in the manufacture of textiles and ropes.

Nettle. Foliage and flowers of common stinging nettle

**Nettle-rash or URTICARIA.** Affection of the skin which occurs in the form of weals or raised patches, at first red and afterwards white and bloodless in the centre, but red at the edges. The condition is more frequent in children than in adults and in females than in males, and is more frequently seen in warm than in cold weather, probably owing to the greater frequency of eating decomposed food and too much juicy fruit, which carries off calcium from the blood, allowing the serum to escape through the vessel walls, thus causing the itching weals. Urticaria may be due to local irritation, such as stings of nettles, insects, jellyfish, etc.; to the eating of unsuitable food, perhaps shell fish, tinned fish, and pork; to the taking of certain drugs; to intestinal parasites; or it may be associated with certain diseases affecting the blood stream, such as diabetes or jaundice.

A saline purgative should be given, anti-itch preparations applied, anti-allergic substances taken, and drugs of the adrenalin family used to shrink the vessels. See Itch.

**Nettle Tree (*Celtis australis*).** Tree of the family Ulmaceae, a native of S. Europe. The oval, lance-shaped leaves are alternate. The small, greenish flowers are succeeded by small, berry-like

fruits, which are black when ripe and very sweet. In Greece they are known as honey-berries. The wood is dense and hard.

**Nettuno.** Italian resort, 31 m. S.S.E. of Rome. Here was anciently a temple of Neptune, hence the name. Pop. est. 3,000.

During the Second Great War British and U.S. troops of the 5th army landed on Jan. 22, 1944, near Anzio (*q.v.*), the port of Nettuno, a position some 60 m. behind the German front line on the Garigliano. The next day Nettuno was captured, and the Appian Way brought within range of Allied artillery.

**Neuchâtel.** Lake of Switzerland. It runs N.E. and S.W., between the cantons of Fribourg and Neuchâtel, and touches those of Berne and Vaud. Its extreme length is 24 m., average breadth 4 m., alt. 1,427 ft., depth 500 ft., and area 92½ sq. m. The surplus waters of Lake Morat are carried to it by the Broye, while it discharges its own by means of the Thiele through the lake of Bienné to the Aar. The towns of Neuchâtel, Grandson, Yverdon, and Serrières stand on its banks.

**Neuchâtel.** Frontier canton of N.W. Switzerland. Traversed by the Jura Mts., it is bounded N.W. by France, N.E. by Berne, S. by Vaud, and S. and E. by the lake of Neuchâtel. It is divided into three regions, viz. Le Vignoble, bordering the lake, with an alt. of from 1,500 ft. to 2,300 ft.; Les Vallées, 2,300 ft. to 3,000 ft., and Les Montagnes, a valley in which stand La Chaux de Fonds and Le Locle.

In the lowest area the vine is cultivated, in the Val de Travers (*q.v.*) is a noted asphalt deposit. Cattle-rearing and cheese-making are engaged in, and there are stone quarries. The manufactures are of watches, electrical appliances, screws and knitting machines, and soft goods. The principality was under the kings of Prussia from 1707 to 1857, except for the period 1806-14, when it was French. In

1815 it entered the Swiss confederation, becoming a full member in 1857. Area, 312 sq. m. Pop. 117,900.

**Neuchâtel** (Ger. *Neuenburg*). A town of Switzerland, capital of the canton of Neuchâtel. It stands at an altitude of 1,300 ft. on the N.W. shore of Lake Neuchâtel, 27 m. by rly. W. of Berne. Fine quays with handsome modern buildings line the lake shore, this new quarter having several public gardens. The old town, to the W., contains a castle of the 12th cent., with later additions; an abbey church, built in the 12th cent., now used for Protestant worship; and a Renaissance market hall, erected in 1570. There are a university, museums, picture galleries, libraries, a school for watchmakers, and many other educational and philanthropic institutions. Neuchâtel has a considerable trade in wine, and manufactures watches, chocolates, jewelry, and printed goods. The in-

Neuchâtel, Switzerland. Hotel de Ville of this town on the shore of Lake Neuchâtel

habitants are mainly French-speaking Protestants. Pop. 23,799.

**Neue Freie Presse.** Formerly Austria's leading daily paper. It was founded in 1864 by Max Friedländer and Michael Etienne, and later published by the Benedict family. It appeared twice daily (12 times a week), was liberal in its political trend and well informed on economic affairs. Its circulation varied from 50,000 to 100,000. It was abolished by the Nazis immediately after the Anschluss of March, 1938.

**Neues Wiener Tageblatt.** Viennese daily paper. It was founded in 1867, and belonged in its later years to the Steyermühl combine, then the biggest paper-making, printing, and publishing enterprise of Austria. Progressive in its views and with the largest circulation in the country, it maintained a high standard and had its own world-wide news service. It was abolished after the Anschluss of Austria and Germany in 1938.

**Neuilly, TREATY OF.** Treaty signed at Neuilly-sur-Seine, Paris, between Bulgaria and the Allied powers, Nov. 27, 1919. By it Bulgaria ceded small portions of territory on its W. frontier to Yugoslavia and lost a large part of Thrace, on the Aegean Sea. The Dobruja, given to her by the treaty of Bukarest, 1918, was restored to Rumania, and in addition she had to demobilise her army, surrender all arms and munitions of war, and carry out certain reparations conditions. See Bulgaria; Dobruja; Greece; Rumania; Thrace.

**Neuilly-sur-Seine.** Suburb of Paris. Lying E. of the Avenue des Champs Elysées and N. of the Bois de Boulogne, it is entered at the Porte Maillot and extends to the Seine. On the N. was a château of Louis Philippe, destroyed by the mob in 1848. Its midsummer fair is a great popular festival frequented by Parisians. Pop. 60,172.

**Neumann, FRANZ ERNST** (1798-1895). German scientist. Born at Joachimstal, Sept. 11, 1798, he made a study of the specific heats of compounds, as a result of which he formulated Neumann's Law in 1831, i.e. that "the molecular heat of a compound is equal to the sum of the atomic heats of its constituents." He also wrote treatises on the dynamical theory of light and other subjects. Neumann died at Königsberg, May 23, 1895.

**Neumünster.** Town of Schleswig-Holstein, Germany. It is situated between Hamburg and Kiel, 18 m. S. of the latter, and is an important rly. junction. It is an agricultural centre, and has valuable educational institutions, though the Heimat museum was totally destroyed during the Second Great War. It was originally called Wippendorf, but took its present name in 1163, after an Augustinian monastery which was established there. Pop. (1950) 70,400. After May, 1945, it lay within the British zone of occupation.

**Neuquén.** Territory in the W. of Argentina. It is bounded N. by the river Colorado and S. by the river Limay. Sloping E. from the Andean system, it is traversed by the river Neuquén, an affluent of the Rio Negro, and is almost wholly mountainous. There are several large lakes in the S. portion, including Nahuel-Huapi (*q.v.*). On the lowlands numbers of cattle, sheep, and horses are reared. Chosmalal is the capital. Area 37,245 sq. m. Pop. est. 35,000.

**Neuralgia.** Affection of the nerves. It may be a manifestation of a neurasthenic state, or due to

debility, anaemia, exposure to cold, toxic influences, as in gout, diabetes, lead poisoning, malaria, etc., pressure on a nerve trunk from a tumour, or to reflex action from a source of irritation, such as a decayed tooth. Women are more often affected than men. An attack may begin with sensations of discomfort or tingling in the part affected, but often the pain comes on quite abruptly. It is usually very severe, and is described as stabbing, burning, or darting in character.

In the treatment of neuralgia the general health should be built up, and for anaemic or debilitated patients a change of air is often necessary. Sufficient exercise in the open air and a generous diet rich in the whole range of vitamin B are important. All sources of sepsis and of peripheral irritation, such as decayed teeth, should be looked for. Warmth applied by hot-water bags or heated layers of flannel to the affected part often relieves painful attacks, as does short-wave therapy. The nature of neuralgia is not understood. Even after the most violent and prolonged pain there is no change in the microscopic appearance of the nerve, which seems to serve merely as a conducting mechanism. See Nervous System; Sciatica; Tic Douloureux.

**Neurasthenia.** Term used popularly to include all forms of neurotic disorder or neurosis (*q.v.*). Physicians, however, now restrict the term to nerve exhaustion, which may result from prolonged physical strain and hardship, or may be the result of long-continued overwork, especially if associated with business or domestic worries. The most characteristic symptom of neurasthenia is the extreme readiness with which the individual is fatigued by physical or mental effort. Other symptoms are sleeplessness, constipation, and sometimes pain in the back and limbs, irritability, and depression. The best form of treatment is mental and physical rest. In severe cases the Weir-Mitchell (*q.v.*) treatment may be adopted.

**Neurath, KONSTANTIN VON** (b. 1873). German politician. Born at Tübingen, 1873, he graduated in law from Berlin university and entered the diplomatic service, being appointed vice-consul in London in 1903. He was councillor at the Constantinople embassy 1914-16, private secretary to the king of Württemberg 1917-18, and minister to Denmark 1919. He was appointed ambassador to Italy in

1921, and to Great Britain 1931-32. He became foreign minister in von Papen's govt. in 1932, retaining his

K. von Neurath,  
German politician

portfolio when Hitler became chancellor in 1933. He represented Germany at the five-power conference on armament equality at Geneva in 1932, and advised Hitler

to withdraw from the conference. In 1938 Ribbentrop replaced him as foreign minister and he became president of the Reich privy council. Following the German occupation of Czecho-Slovakia, he became Reich protector of Bohemia and Moravia in March, 1939. He introduced there Nazi racial laws, abolished trade unions and political parties, and when the Second Great War broke out harnessed Czech industry to the German war effort. He had, however, intervened with the secret police on behalf of many Czech students arrested after the occupation of their country, and in 1941 he was recalled for having been "too lenient," and sent into compulsory retirement. In 1943 he re-emerged as a general of S.S. Listed as a war criminal, Neurath was arrested by French troops in the closing days of the war in Europe and brought to trial before the international court at Nuremberg. He was found guilty on all counts, but the court recognized mitigating circumstances, and, on Oct. 1, 1946, he was sentenced to 15 years' imprisonment.

**Neuritis.** Inflammation of the trunk of a nerve. It may be localised in one nerve or may be multiple. Localised neuritis is most often due to exposure to cold, injury of a nerve, or extension of inflammation to a nerve from adjacent inflamed tissue. The symptoms are pain in the course of a nerve, and perhaps slight reddening and swelling of the part affected. The functions of the muscles supplied by the nerve are impaired, and there may be some loss of sensation in the skin to which the nerve is distributed. If the condition becomes chronic, there is ultimately extreme wasting of the muscles, with paralysis and possibly contractions.

Multiple neuritis may occur in the course of infectious diseases such as leprosy, diphtheria, and smallpox, may be due to poisoning by alcohol, lead, arsenic,

mercury, and other substances, or may arise in the course of beriberi. In acute multiple neuritis there are constitutional symptoms, such as rise of temperature and headache, with pains in the limbs. Paralysis of the legs and arms appears, with rapid wasting of the muscles. Most patients recover, though improvement may be slow and the paralysis may continue for a year or even longer. Alcoholic neuritis is the most frequent form of multiple neuritis.

In neuritis due to acute poisoning the outlook for recovery is usually good, but the prognosis in neuritis due to long-standing chronic lead-poisoning is not hopeful. Rest is an essential feature of treatment, and in acute cases the patient should remain in bed. Hot applications may be used to relieve pain, and short-wave therapy may be helpful. The cure is the cure of the cause.

**Neuroma.** Tumour which develops on nerve fibres. True neuromata consist of nerve tissue; false neuromata of fibrous tissue. See Tumour.

**Neuron.** Nerve cell. A typical neuron consists of a cell body containing a nucleus, and various fine processes which break up into smaller branches called dendrons. In many cells one of the processes is of great length and forms a nerve fibre, which, with other fibres, constitutes a nerve. The nerve fibre itself breaks up into small branches which are distributed to muscle, skin, and other tissues.

**Neuroptera** (Gr. *neuron*, nerve; *pteron*, wing). Order of insects undergoing complete metamorphosis and bearing two pairs of net-veined transparent wings which are closed roof-like over the body when at rest. The wings of one side are closely alike in size and shape; the antennae are rather long and thread-like and there are no cerci. Both the larvae and adults are carnivorous, preying chiefly upon small insects. There are 60 British species which include the Alder-flies (*Sialis*), Snake-flies (*Raphidia*), Lacewings (*Chrysopidae* and *Hemerobidae*). In the tropics the Ant-lion flies (*Myrmelion*) attain a large size. No species is injurious to man. Consult British Neuroptera, Killington, 1936-37.

**Neurosis.** Disorder of the mind not associated with any recognizable organic changes, and distinguished from insanity by the fact that it affects chiefly the emotions, and leaves the reasoning powers relatively unimpaired. There are

borderline cases in which it is difficult to diagnose between a neurosis and the early stage of some mental disorders. Understanding of these disorders has been much advanced during the 20th century.

Psychologists now classify neurotic disorders into two main groups, according to their mode of origin, i.e. the "actual" or "true" neuroses, and the psychoneuroses. The essential difference between these sub-groups is that the cause of the actual neuroses can be traced ultimately to some physical disturbance, whereas the psychoneuroses have a purely mental origin and are the last links in a chain of mental processes. The actual neuroses are of various types, and include neurasthenia, anxiety neurosis, and hypochondriasis. Anxiety neurosis is characterised by sudden attacks of acute fear which occur without any cause, and which the patient himself recognizes as being entirely unreasonable. Those who suffer from this disorder have frequently not been able to find a satisfactory outlet for their emotions, either as a result of social circumstances or deliberate suppression. An understanding of the cause of the condition is very helpful to them.

The psychoneuroses are hysteria, psychasthenia, and obsessional neurosis. These conditions are caused by a conflict between the conscious and unconscious parts of the mind. Despite his civilization, man still shares with the lower animals many fundamental tendencies and desires, gratification of which is often in direct conflict with the social teaching and the moral and ethical code to which the individual has been obliged to conform from early childhood. The result is that these wishes are either never allowed to reach consciousness or, if they do, are at once repressed by the individual. Freud has shown that in his development the child passes through a series of emotional phases before maturity is reached.

The exigencies of civilization demand that everyone must experience this process, and most people go through it successfully, i.e. they make the suppressions and repressions necessary to fit them to their environment. Sometimes, however, the suppression is not complete, or the unconscious desire tends to become too strong for the inhibiting forces. The result is that symptoms appear which represent a compromise, and it is these which constitute the neuroses. Treatment consists in investigating the

patient's mind and ascertaining the fundamental nature of the conflict which, unknown to himself, is occurring. This process is called by Freud psychoanalysis.

The normal mechanism of repression sometimes fails to deal adequately with the root causes of neurosis, and punishment symptoms become obvious, e.g. a hysterical paralysis, which cripples a soldier and prevents him from remaining at the front.

**Neuruppin.** Town of Germany, in the *Land* of Brandenburg. It is near the lake of Ruppín, and is situated 30 m. N.W. of Berlin, in a wooded and hilly countryside. It is a rly. junction and is on the Ruppín canal. It had a 13th century church, many fine 18th century buildings, and possessed a school founded in 1365 and many other educational institutions. It was a centre of the manufacture of brushes, leather and iron goods, and was originally established as a town in 1256, and reconstructed by Frederick William II in 1787 after a disastrous fire. After the surrender of Germany in May, 1945, it lay in the Russian zone of occupation. Pop. (pre-war) 21,635.

**Neusalz** (Pol. Nowa Sól). Town and river port of Silesia, under Polish administration since 1945. Situated on the Oder, 75 m. N.W. of Breslau, Neusalz is an old town, having a R.C. church built in 1597. Industries were yarn-spinning, iron, soap, and paper manufacture. Pop. (pre-war) 16,935; German inhabitants were expelled after 1945.

**Neusatz.** German name of the Yugoslav town Novi Sad (*q.v.*).

**Neuse.** River of North Carolina, U.S.A. Rising in the N. portion of the state, it flows 300 m. S.E. to Pamlico Sound, which it enters on the W. side by a wide estuary about 35 m. long. It is navigable for vessels of light draught for nearly 70 of its 300 m.

**Neusiedler See.** Lake of Central Europe. It is crossed by the frontier between Austria and Hungary, and is known to the Magyars as Fertő. The lake is so shallow that its size fluctuates, and in 1865 it dried up completely. The E. side is low and marshy and surplus waters flow away here by the Rábnitz to the Raab and Danube. When the bed is exposed remnants of lake dwellings are visible. The swamps at the S.E. end have been partially reclaimed.

**Neuss.** Town in the German Rhineland. Near the junction of the Erft with the Rhine, 4 m. W. of Düsseldorf, it was a pre-Roman

Celtic settlement and the Roman Novesium. A Benedictine abbey of the 9th century became later a seat of the archbishops of Cologne. The 13th century church of S. Quirinus, badly damaged in the Second Great War, marks the transition from Romanesque to Gothic. The Renaissance town hall (1638), the arsenal, and the museum were destroyed in that war, and remnants of fortifications deserve mention. Neuss had important engineering, soap, chemical, paper, and food industries, and as an inland port handled up to 4,000 vessels and a million tons a year. Pop., pre-war, 55,971. *Pron.* Noyce.

The U.S. 9th army reached the Rhine at Neuss, capturing it March 3, 1945, after fierce street fighting. After the surrender of Germany it lay within the British zone of occupation.

**Neustadt** (Ger., Newtown). The name of 22 towns in Central Europe, most of them in Germany. The biggest is Neustadt an der Haardt, in the Palatinate, 25 mi. W. of Heidelberg. It was founded 1235, granted urban rights in 1275, and frequently conquered by the French, also by Spaniards and Swedes in the Thirty Years' War. Now an industrial town, with metal, engineering, textile, wood, and paper works, and a centre of the Palatinate wine trade, it has a huge Gothic church of the 14th century, a former theological seminary (1579), and a town hall (1743). During the Second Great War it was captured by the U.S. 3rd army March 21, 1945; after the surrender of Germany it lay in the French zone of occupation. The neighbouring Maxburg castle at Hambach (c. A.D. 1000) was the centre of German democratic demonstrations. Pop. 23,135.

Neustadt (Pol. Prudnik) on the Prudnik river, is 15 m. by rly. S.E. of Neisse. Built round medieval and 18th cent. remnants of a monastery, it had linen and leather industries, and a pop. of 17,892 before the Second Great War, during which it was captured by the Russians, March 22, 1945. It was in the area of Germany occupied by Poland at the end of the war. Neustadt near Coburg, with its old church where Luther preached, was a centre of the toy industry of Thuringia. It lay in the Russian zone after the Second Great War. *Pron.* Noystaht.

**Neustrelitz.** Capital town of what was formerly the grand duchy, and then up to 1945 the German state of Mecklenburg-Strelitz; now in Russian occupa-

tion. It was laid out early in the 18th century, in the form of an eight-rayed star around the palace (1726-31), a fine Renaissance pile with Greek elements. Parks, museums, a great library, monuments, and the nearby lakes are attractions in an essentially agricultural town, which has rly. and canal connexion with Berlin and the Baltic. Pop. (1950) 26,000.

**Neustria.** Name given to a Frankish kingdom which had an independent existence in the 6th-8th centuries. It was so called because at the time it was the newest conquest of the Franks. It was the western of two kingdoms, Austrasia being the eastern one, and was bounded roughly by the Seine, the Loire, and Brittany. After the union of the two kingdoms in the 8th century, the word Neustria remained for some time in use, but the district to which it applied was never exactly defined.

**Neutrality.** Term used in international law to denote the condition of a state when there is a war, and that state is not at war with either belligerent. It dates from the 17th century. The duty of a neutral, put generally, is to refrain from giving effective assistance to either belligerent—a duty which is construed ever more widely. Thus, a neutral must not, when a place is besieged, introduce supplies into that place, because that would be interfering with a military operation; nor may he grant loans or furnish munitions of war to either belligerent. Still less may he allow either belligerent to prepare on his territory warlike acts against the adversary.

A neutral ship which tries to break a blockade is liable to capture. A neutral state must not allow belligerent ships of war to use its harbours, except under stress of weather, and then only for a limited time and not to replenish armed stores. A belligerent must not march troops into or through neutral territory; and if soldiers of a belligerent, to escape capture, or even by mistake, overstep the border of a neutral state, the latter ought to compel them to surrender, and to intern them until the end of the war, such troops being bound to surrender if called upon. The real difficulty in time of war is to reconcile the claim of the neutral state to prosecute its lawful commerce with the claims of a belligerent who has control of the seas to establish a blockade of his adversary's ports and to intercept contraband of war. When great states make war, this virtually means

that a neutral can trade only as prescribed by the naval power.

In 1780 and 1800, during the naval wars, the Baltic powers proclaimed an "armed neutrality." They set up the doctrine of "free ships, free goods"—i.e. goods carried in neutral ships, even contraband, should not be liable to capture—which would have abolished the right of visit and search upheld by Great Britain. The Baltic ships were formed into convoys, protected by ships of war; but Great Britain carried her point, and visit and search was recognized as the law of the sea in time of war.

During 1936-39 Great Britain and France evolved the policy of non-intervention in respect of the Spanish Civil War. This went beyond neutrality and aimed at removing every possible ground of provocation that might lead to being involved in the war. The U.S.A. adopted a similar policy (embodied in the Neutrality Act of 1937) designed to keep her out of any war in Europe.

The covenant of the League of Nations and the United Nations charter introduced a new conception of neutrality. In any war today one of the belligerents will be at war contrary to its international obligations; and other members of the community of nations will be entitled to take reprisals against that belligerent and to allow the other belligerent to do acts which are not in accordance with the old conception of their duty as neutrals. This change was illustrated in the Second Great War when the U.S.A. transferred 50 destroyers to the U.K., and by the Lend-Lease Act, 1941. *See* Angary; Contraband; International Law; Non-belligerency.

**Bibliography.** *Studies in International Law*, T. E. Holland, 1898; *International Law*, G. Schwarzenberger, 1945; *International Law*, 2 vols., Oppenheim, 8th ed. 1947.

**Neutrino.** Atomic particle. Its existence was suggested by Pauli to account for the continuous distribution of energy and for the conservation of energy in nuclear processes. He suggested that both the electron and the neutrino are emitted by the nucleus in a  $\beta$ -ray disintegration. Study of the energy distribution of the  $\beta$ -rays emitted by a radio-active substance had led to the conclusion that, unless the principle of the conservation of energy was to be abandoned as applied to internuclear processes, the emission of a  $\beta$ -particle must be accompanied by the simultaneous emission of another particle.

This latter, neutrino, was assumed by Fermi to have zero mass, to be uncharged, and to have a spin of  $\frac{1}{2} \left( \frac{h}{2\pi} \right)$ , where  $h$  is Planck's constant. Since the neutrino has a mass probably smaller than that of the electron, and no electric charge, there is no present possibility of making observations on it.

**Neutron.** Fundamental heavy atomic particle of zero charge. Its mass is slightly greater than that of the hydrogen atom. As it is uncharged the neutron is affected only by atoms at very close range, and so can pass through thick layers of heavy elements with little loss of energy.

**Neuve Chapelle.** Village of France, in the dept. of Nord,  $8\frac{1}{2}$  m.

Neuve Chapelle. Memorial to those Indian soldiers who died in France in the First Great War, and who have no known graves

S.W. of Armentières. It gives its name to an important battle of the First Great War. The old village was almost destroyed in the war.

The battle was fought between British and Germans, March 10-12, 1915. Sir John French, British c.-in-c., determined upon an attack to prevent the dispatch of German reinforcements to the E. front and to assist the French at Arras. The point selected was Neuve Chapelle, which had been on the German side of the line from Oct., 1914. The assault was made by the 4th corps, under Rawlinson, from the N., and the Indian corps, under Willcocks, from the S., with the 3rd and 1st corps making holding demonstrations to the N. and S. respectively. The German front was held by the 6th army. In spite of inadequate British munition supply, enough had been accumulated for a violent 40-minute bombardment by 480 guns. The R.F.C. secured decided local superiority in the air.

The bombardment opened at 7.30 a.m., March 10, and airmen bombed rly. bridges and junctions to the German rear. The infantry advanced at 8.5. The Indians carried four lines of trenches and en-

tered the village. To the N. the 4th corps found the artillery had been less successful in preparing the ground, and losses were heavy; but they also reached the village, where all resistance was ended by 11 a.m. The plan now required a further advance E. to drive a deep wedge into the German front before the Germans had recovered from the initial surprise. But this was held up for some hours by the late arrival of reserves, through faulty staff work. The Germans were able to take up strong positions, and the attack came to a standstill after about 1 m. of ground had been gained and the Neuve Chapelle salient cleared.

A renewal of the attack was ordered on the 11th, but the order did not reach all units; and an attack by units of the Indian corps was beaten back with heavy loss. By March 12 German reserves had arrived to deliver a number of counter-attacks, though no ground was regained. British casualties were 2,527 killed, 8,533 wounded, 1,751

missing. German losses were almost as large. On the section captured by the Indians 2,000 German dead were counted. A shrine in memory of Indian soldiers was unveiled at Neuve Chapelle in 1927.

**Neuwied.** Town of Germany, 8 m. N. of Coblenz on the right bank of the Rhine, where it is joined by the little river Wied. The chief building is the palace, once the residence of the princes of Wied, which stands in a large park. The chief industries are the manufacture of soap, tobacco, and various iron and engineering products. A feature of the place is the Moravian colony, to one of whose schools here George Meredith was sent as a youth. In the little county of Wied, Neuwied was founded by one of the counts (later princes) of Wied in 1653, and was made their residence. There had been a village here named Langendorf. Pop. (1939) 21,875.

**Neva.** River of N.W. Russia, in the region of Leningrad. Rising in Lake Ladoga, it flows S.W., then N.W. through Leningrad, and, dividing into several branches, discharges itself into the Bay of Neva in the Gulf of Finland. It

is an important commercial waterway, the final link in the communication between Leningrad and the White and Caspian Seas. Length 45 m.

**Nevada.** Western state of the U.S.A. Lying almost entirely within the Great Basin, a plateau at the foot of the Sierra Nevada and Wasatch mts., its surface (mean alt. 5,500 ft.) is marked by numerous small mountain ranges, between which lie tracts of marshy lands, converted at times into large lakes. Boundary Peak (13,145 ft.) in the W. is the highest point in the state. The principal river is the Humboldt, and the S. Pacific rly. follows the course of the river. Mining is important—the state includes the famous Comstock lode, long a rich source of gold and silver, as well as deposits of many other minerals; but its principal industry is dry-farming by means of irrigation. Forage crops, fruit, and vegetables are the principal crops. Cattle are raised, in particular on public lands, which form 87 p.c. of the state's area. The city of Reno (*q.v.*) has become notorious as a place for easy divorce: the state laws require no notice of a divorce suit, and only six weeks in which to establish residence. Las Vegas, in the S.W., is a gambling centre, accessible to Los Angeles and Hollywood by motor road. Boulder Dam (*q.v.*) is 25 m. S.E. of Las Vegas.

Nevada was part of the territory taken from Mexico in 1848. It became a state of the U.S.A. in 1864, and sends two senators and one representative-at-large to congress. For local affairs it has a state legislature of two houses. Its area is 110,540 sq. m., and its pop. (approx. one person per sq. m.) 110,247, inc. about 5,000 Indians. It is the most arid and least populous of the 48 states. *Consult* Desert Challenge: an Interpretation of Nevada, R. G. Lillard, 1942.

Nevada City, situated in California, 165 m. N.E. of San Francisco, is the co. seat of Nevada co.

**Nevers.** City of France. It stands where the Nièvre falls into the Loire, 32 m. from Bourges and 160 from Paris, and is the capital of the dept. of Nièvre. The cathedral of S. Cyr was begun in the 11th century and finished about 1500. It was originally two buildings, and is Romanesque at one end and Gothic at the other. The church of S. Etienne is noteworthy. The castle in which the counts and dukes of Nevers lived is now the palais de justice and a museum.

Nevers. East end of the cathedral of St. Cyriac

It was built in the 15th century, replacing an earlier edifice. Of the city's fortifications a tower remains. There are a town hall, a triumphal arch, and a number of old houses in the steep and narrow streets. The industries include potteries, tanneries, oil mills, iron foundries, and the making of boots and shoes. Nevers began as a Roman settlement. About 500 a bishopric was founded here, and about 1000 the counts of Nevers appeared, the county being known as the Nivernais. At one time in possession of the dukes of Burgundy, it was made a duchy about 1530. The last duke, a member of the family of Mazarini, died in 1798. Pop. 34,036.

**Nevill, Lady Dorothy Fanny** (1826-1913). British writer. She was born in London, April 1, 1826, daughter of Horatio Walpole, third earl of Orford (1783-1858). In 1847 she married her cousin Reginald Nevill (d. 1878), and became known as a hostess. She was author of *Mannington*

Lady Dorothy Nevill.  
British writer  
Elliott & Fry

and the *Walpoles*, earls of Orford, 1894; *Reminiscences*, 1906; *Leaves from the Note Books of Lady Dorothy Nevill*, 1907; *Under Five Reigns*, 1910. Died March 24, 1913.

Her third son, Ralph Henry, wrote *Life and Letters of Lady Dorothy Nevill*, 1919.

**Neville.** Name of an English family. Founded in the 12th century, it was connected with Durham, Northumberland, and Yorkshire. Ralph (d. 1367), 2nd baron, defeated and captured David Bruce at the battle of Neville's Cross, 1346. Another Ralph (1364-1425) became earl of Westmorland and married a daughter of John of Gaunt; while his daughters married leaders of the Yorkist

and Lancastrian parties. Ralph's grandson Richard, earl of Warwick, was the greatest figure in the family. Charles (1543-1601), 6th and last earl of Westmorland, took part in Northumberland's rebellion of 1569, was attainted, and forfeited his estates, including Raby Castle (q.v.). Junior branches of the family hold the titles of Aberbrooke (q.v.). See *Warwick Earl of*.

**Neville's Cross, BATTLE OF.** Fought between the English and the Scots, Oct. 17, 1346. During the absence of Edward III on campaign in France, David, king of Scots, invaded and ravaged the north of England. The English nobles, with the archbishop of York, marched to repel the invasion, and the two armies met at Neville's Cross, near Durham. The English archers opened the fight, and the Scots were defeated with heavy loss, their king being among the prisoners.

**Nevinson, Christopher Richard Wynne** (1889-1946). British painter. Son of H. W. Nevinson (v.i.), he was born in London, Aug. 13, 1889, and educated at Uppingham, the Slade school, and Paris. First exhibiting in London, 1910, he showed regularly with the

C. R. W. Nevinson,  
British painter

New English Art Club, and later at the Royal Academy, of which he became an associate in 1939.

An official war artist during the First Great War, he adapted the methods of Cubism to express the facts of mechanical warfare, a notable example being *La Mitrailleuse*, in the Tate gallery. Later he developed a more naturalistic style, and in the Second Great War painted notable studies of aircraft in flight. In 1927

H. G. Wells presented his painting *Studio in Montparnasse*, to the Tate. Nevinson published an autobiography, *Paint and Prejudice*, 1937. He died Oct. 7, 1946.

**Nevinson, Henry Woodd** (1856-1941). British writer. Born at Leicester, Oct. 11, 1856, he was educated at Shrewsbury, Christ Church, Oxford, and Jena university. He went to Crete during the Greek rebellion against the Turks, 1896, and his dispatches appeared in the *Daily Chronicle*. He later joined the staff of that newspaper. After reporting the Cuban war, he went to S. Africa, where he was in the siege of Ladysmith. He was leader writer to the *Daily News*, 1908-10, for which, with the *Daily Telegraph*, he was a war correspondent during the First Great War. His marked sympathy for the oppressed was combined with a sense of irony. President of the London P.E.N. in 1938, his publications included three autobiographical works, *Changes and Chances*, 1923; *More Changes, More Chances*, 1925; and *Last Changes, Last Chances*, 1928, and an astute study of the English character, *Rough Islanders*, 1930. He died Nov. 9, 1941.

H. W. Nevinson,  
British writer

**Nevis.** Loch or arm of the Atlantic Ocean in the S.W. of the co. of Inverness. It is a typical Scottish sea loch, 14 m. in length, and from 1 to 4 m. wide. See *Ben Nevis*.

**Nevis.** Island of the British West Indies, one of the Leeward group. It lies 2 m. S.E. of St. Kitts, with which and Anguilla (q.v.) it is administratively joined.

C. R. W. Nevinson. *Notre Dame de Paris*; an example of this painter's later and more naturalistic style

Its maximum length is 8 m., breadth 4 m., and area 50 sq. m. There are mineral springs near Charlestown, the port and capital on the S.W. coast. Cotton, sugar, cocoa, limes, vanilla, oranges, and coconuts are produced. Discovered by Columbus in 1498, Nevis was colonised by the English in 1628. Pop. 11,383.

**Nevski Prospekt** (Russ., Neva Street). Main thoroughfare of Leningrad, now usually called Oct. 25 Prospekt, and the centre of the commercial life of the city. Among the numerous important buildings on its line of route are the Kazan cathedral and the Duma (town hall). See Leningrad, illus., p. 5074.

**New Albany.** City of Indiana, U.S.A., the co. seat of Floyd co. It stands on the right bank of the Ohio river, 4 m. N.W. of Louisville, and is served by the Chicago, Indianapolis, and Louisville and other rlys. Once a great river port and the largest city in Indiana, the coming of the rly. era has lessened its importance and it is now a centre of the timber and plywood trade. Organized as a town in 1813, it became a city in 1839. Pop. 25,414.

**New Amsterdam.** Town of British Guiana, S. America. It stands near the mouth of the river Berbice, at its junction with the Canje, 65 m. by rly. S.E. of Georgetown. Rice is grown in the surrounding districts. It was founded by the Dutch, who constructed a system of canals connecting various parts of the town. Most of the houses are built of wood. Pop. 10,000. New Amsterdam was the name given by the Dutch to their settlement on Manhattan Island which became New York city in 1664.

**Newall,** CYRIL LOUIS NORTON, 1st BARON (b. 1886). British airman. Born Feb. 15, 1886, and educated at Bedford school and Sandhurst, he qualified as a pilot in 1911, and shortly before the First Great War was engaged in the formation of a flying-school. During the war he served with the R.F.C., becoming chief staff officer, S.E. area, and deputy director of personnel at Air Ministry from 1918. In 1926 he became director of operations and deputy chief of Air Staff. Promoted air vice-marshal in 1930, he held the Middle East R.A.F. command, 1931-34, and in 1937 became air chief marshal. Chief of air staff, 1937-40, he became marshal of the R.A.F. in 1940, and was governor-general of New

Zealand, 1941-46. He was knighted in 1935 and created a baron in 1946. In 1940 he was awarded the O.M.

**Newark.** Mun. bor. and market town of Nottinghamshire, England. It is on the Devon, near its union with the Trent, and is connected with the main course of that river by a short canal. It is 20 m. from Nottingham and 120 m. by rly. from London. The chief building is the church of S. Mary Magdalene. There is a grammar school dating from 1529, town hall, corn exchange, hospital, and free library. The Beaumont Cross is a fine piece of 15th century work.

Newark is the centre of a large agricultural district, and holds an important corn market. The industries include the making of machinery and plaster, iron and brass founding, brewing and malting, while gypsum and limestone are worked in the neighbourhood. Annual fairs are held. The castle, built in Anglo-Saxon times, and rebuilt in the 12th century, was the scene of John's death in 1216. It was held for the king during the Civil War until it surrendered to the Scots in 1646. Then demolished, the ruins include a Norman gatehouse. In 1549 Newark was made a chartered town; it had an M.P. 1673-1885. It now gives its name to a co. constituency. Market day, Wed. Pop. 23,120.

**Newark.** City and port of entry of New Jersey, U.S.A., the metropolis of the state and the co. seat of Essex co. It stands on the Passaic river, 9 m. by rly. W. of New York, and is served by the Pennsylvania and other rlys., also by "tube" and electric rlys. to towns in the neighbourhood, and by steamers. The Pulaski skyway, a 3½ m. viaduct, is 145 ft. above the Hackensack and Passaic rivers. Newark has a busy airport, centre of U.S. domestic traffic. Among the public buildings are the city hall, county court house, and R.C. cathedral.

An important industrial city, Newark has manufactures of jewelry, leather, chemicals, cutlery,

brass and iron products, boots and shoes, clothing, glass, etc. It has 19 insurance companies, employing 30,000 workers. Originally known as Milford, it was settled in 1666 by a colony from Connecticut, and became a city in 1836. Pop. 429,760, in which the Italian element is dominant.

**Newark.** City of Ohio, U.S.A., the co. seat of Licking co. It stands on the Licking river, 32 m. E. of Columbus, and is served by rly. and the Ohio Canal. Boots and shoes, flour, and chemicals are manufactured here. Textiles from glass have been made since 1933. The Baltimore and Ohio Rly. has works here. Settled in 1801, Newark was incorporated in 1813. Pop. 31,487.

**Newark Series.** In geology, series of rocks of Triassic age in E. of U.S.A. The series locally carries coal seams and its sandstones are valuable for building.

**Newbattle.** Parish and village, Midlothian, Scotland. It is on the South Esk river, 1 m. S. of Dalkeith. Newbattle Abbey, a seat of the marquess of Lothian, occu-

Newark, Nottinghamshire. Ruins of the gatehouse and walls of the historic castle in which King John died

pies the site of a Cistercian abbey founded in 1140 by King David I.

**New Bedford.** City and port of entry of Massachusetts, U.S.A., the co. seat of Bristol co. It stands on the Acushnet river, whose mouth expands into a commodious harbour, 55 m. S. of Boston, and is served by the New York, New Haven, and Hartford Rly., and by a series of steamers. New Bedford is an important cotton centre, and other manufactures are silk, cut glass, machine-shop and foundry products. Its once famous whale fishery is now almost extinct. New Bedford was incorporated in 1812, and became a city in 1847. In 1928 a strike of textile operatives led here to a new agreement for cooperation to increase production. Pop. 110,341.

**Newbery,** JOHN (1713-67). British publisher. The son of a Berkshire farmer, he became

part proprietor of the Reading Mercury in 1737. In 1740 he set up a publishing business, which he moved to London in 1744, issuing the Universal Chronicle or Weekly Gazette in 1758, and the Public Ledger in 1760. Johnson, Goldsmith, and Smollett wrote for him, and he is described in The Vicar of Wakefield. Newbery, who made a feature of children's books, including Goody Two Shoes, was also a patent medicine vendor. He died Dec. 22, 1767.

**Newbolt, Sir Henry John** (1862-1938). British poet. He was born at Bilston, June 6, 1862, and educated at Clifton and at Corpus Christi, Oxford. For twelve years he practised as a barrister, but having published an historical novel, Taken from the Enemy, in

Sir Henry Newbolt,  
British poet  
Russell

1892, and rousing verses of the sea, Admirals All, 1897, he gradually left the law to make literature his profession. His later work included The Island Race (1898), The Sailing of the Long Ships, and The Book of the Happy Warrior. Many of his poems, such as Drake's Drum, and the sequence, Songs of the Fleet, became even more widely known when set to music by Stanford. Also popular were Clifton Chapel and Vital Lampada ("There's a breathless hush in the close-to-night"). Knighted in 1915, he was professor of poetry in the Royal Society of Literature, 1911-21. His autobiography, My World as in My Time, was pub. 1932. He died April 19, 1938.

**New Brighton.** Watering-place of Cheshire, part of the county borough of Wallasey. It stands at the junction of the Mersey and the Irish Sea. It has a rly. station, and is connected by ferry steamers with Liverpool and Birkenhead. There is a sea front of 7 miles, with sports facilities. Pop. 6,996. See Wallasey.

**New Brighton.** Part of New York City, U.S.A. Formerly a separate town on the N.E. shore of Staten Island, it was incorporated with Richmond, one of the New York boroughs, in 1898.

**New Brighton.** Borough of Pennsylvania, U.S.A., in Beaver co. It stands on the Beaver river, 29 m. N.W. of Pittsburgh, and is served by the Pittsburgh and Lake Erie rly. The town grew

from Big Beaver blockhouse, erected during the war of independence. It was first acknowledged as a town in 1815, and incorporated in 1838. Pop. 9,960.

**New Britain** or **NEW POMERANIA.** Island of the Bismarck Archipelago (*q.v.*). It is separated from the E. coast of New Guinea or Papua by Dampier Strait. Its length is about 300 m., and its breadth narrows to 10 m.; its area is about 10,000 sq. m. The coasts are low and fertile, but the interior is mountainous and includes several volcanoes, some active. The highest point is The Father, alt. 7,500 ft. Well wooded, and with rich vegetation, it has a heavy rainfall and a moist, warm climate. Its N. projection, the Gazelle Peninsula, contains the former German settlement and port of Herbertshöhe, now Kokopo (*q.v.*). There are numerous plantations under rubber, coffee, and cotton. The natives are Melanesians and the pop. is 90,349. It was occupied by Australians in 1914, and government was taken over by Australia under League of Nations mandate, later under U.N. trusteeship.

In the Second Great War Japan's assault on New Britain began on Jan. 4, 1942, when the aerodrome at Rabaul was raided. On Jan. 23 Japanese troops landed there, meeting with fierce opposition from Australian forces. There was a further landing at Gasmata on Feb. 10, the occupation of the island being completed by the end of the month. On Dec.

15, 1943, U.S. and Australian troops landed on Arawe pen.; and eleven days later U.S. marines began to establish themselves on both sides of C. Gloucester. The two forces linked on Feb. 24, 1944. On March 6 and 9 further landings were made near Talasea; and the Japanese withdrew from their bases at C. Hoskins and Gasmata into the Gazelle pen., covering Rabaul, into which port, however, shipping no longer ventured. About a year later the Australians, who in Nov., 1944, had taken over full responsibility for New Britain, began by a series of small but fierce operations to exert pressure on the Japanese, who withdrew slowly N. Fighting was still

going on when Japan surrendered in Aug., 1945. The surrender of all Japanese forces in the S.W. Pacific was signed in St. George's channel, 28 m. S.E. of Rabaul on board the aircraft carrier H.M.S. Glory on Sept. 6. In New Britain, as in New Guinea, the native pop. refused voluntary help to the Japanese.

In 1947 Kokopo was selected as the administrative capital of New Britain. Rabaul, formerly capital of the mandated territory of Australian New Guinea, was so badly damaged during the Second Great War that in 1946 it was decided not to rebuild it.

**New Britain.** City of Connecticut, U.S.A., in Hartford co. It is 10 m. S.W. of Hartford, and is served by the New York, New Haven, and Hartford rly. The chief buildings are the state normal school and the R.C. cathedral. New Britain is noted for its hardware. Settled in 1687, it was incorporated in 1850, and became a city in 1871. Pop. 68,685.

**New Brunswick.** Maritime prov. of the dominion of Canada. It is bounded N.W. by the prov. of Quebec, W. by the U.S.A., and on the other sides by the sea, except where the narrow isthmus of Chignecto separates it from Nova Scotia. The surface is undulating, the only flat region lying along the E. coast. In the N. are a number of low spurs

New Brunswick  
arms

New Britain. Map of the island in the Bismarck Archipelago, the scene of much fierce fighting in the Second Great War

of the Appalachians. The deeply indented coast, which includes Chignecto and Miramichi Bays and the estuary of the St. John, has many fine harbours. Grand Manan and Campobello islands, both fishing centres, lie off the coast. The longest river is the St. John (400 m.), others being the Miramichi, Restigouche, forming part of the N. boundary, and St. Croix. Grand Lake is the largest lake.

Much of New Brunswick is covered by forests, in which moose and caribou are found, and lumbering and the making of wood-pulp are important industries. The soil is fertile; wheat, oats, barley, and other crops, including apples and potatoes, are raised, cattle are reared, and there is some dairy farming, though more than half the land suitable for farming is not occupied. Iron, coal, gypsum, oil, and other minerals are mined, and natural gas exists. There is a large fishing industry, and ample water power. The railways in the province are the C.P.R. and the Canadian National system. Saint John, the principal port, is open all the year round, and other important centres are Fredericton, the capital, and Moncton.

The prov. is represented in the Dominion Parliament at Ottawa by 10 senators and 11 members of the house of commons. For controlling local affairs there is a parliament of one house, its 48 members being elected for five years and two months, unless sooner dissolved by the lieutenant-governor. Responsible to this is a ministry under a premier, and the depart-

ments include those of education, agriculture, land, etc. The towns and rural districts have elected bodies to manage their own affairs. Until 1892, when the legislative council was abolished, the parliament consisted of two houses.

New Brunswick was settled by the French in 1604. Settlers from England and Scotland arrived about 1762, but the province really dates from the end of the American War of Independence, when many loyalists from the U.S.A. made their homes here. In 1784 it was separated from Nova Scotia and made into a distinct prov. It was given a representative assembly, but it was not till 1848 that this obtained any control over the executive council. In 1867 New Brunswick became one of the provinces of the dominion of Canada. Its area is 27,985 sq. m. Pop. 457,401. *See* Canada.

**New Brunswick.** City of New Jersey, U.S.A., the co. seat of Middlesex co. It stands on the Raritan river, at the head of navigation, 30 m. S.W. of New York, and is served by rly. and canal. Here is the state university, including Rutgers College (1766). Surgical

appliances and pharmaceutical products are made. Settled in 1681, New Brunswick was incorporated in 1736, and became a city in 1784. Its present name was given in 1714, to celebrate the fact that a member of the house of Brunswick was king of Great Britain. Pop. 33,180.

**New Brunswick, UNIVERSITY OF.** Educational centre at Fredericton, N.B. It was founded in 1859 to take over King's College, an establishment dating from 1800. The government of the prov. controls its working. Strong in applied science, especially engineering and forestry, it has laboratories, museums, an observatory, and a library. There is a law faculty at Saint John.

**Newburg.** Name of several towns and villages in the U.S.A. The largest, 6 m. S.E. of Cleveland, Ohio, with iron and steel industries, has been incorporated into the neighbouring city. Another is situated on the Ohio river, 10 m. E. of Evansville in Indiana. It is in a noted tobacco-growing district, and has industries connected with coal and coke. Another Newburg is 13 m. E.N.E. of Grafton in

West Virginia. Others are in Maine, 15 m. W.S.W. of Bangor; in Pennsylvania, 6 m. N.N.W. of Shippensburg; in Wisconsin, on the Milwaukee river, 33 m. S.E. of Ford du Lac; and in Missouri, in Phelps co., on the St. Louis and San Francisco rly.

**Newburgh.** Royal and mun. burgh and seaport of Fife, Scotland. It stands on the Firth of Tay, 11 m. from Perth, and has a railway station. There is a town hall, and the industries include fishing and the manufacture of floor-cloth, linen, etc. Some shipping is carried on from a small harbour. The property of the abbots of Lindores, Newburgh was made a burgh in 1266. The ruins of the Benedictine abbey of Lindores, founded in 1178, outside the town, can still be seen: also Macduff's Cross, where the clan was granted sanctuary after a murder. Pop. 2,500.

New Brunswick. Map of the Canadian maritime province lying between Quebec and Nova Scotia

**Newburgh.** City of New York, U.S.A., in Orange co. It stands on the right bank of the Hudson river, 58 m. N. of New York city, and is served by rlys. and by steamers. Settled by Germans in 1709 and once a whaling port, Newburgh has become a link between the Pennsylvania coal mines and the New England market and has varied industries. Washington's headquarters, a stone structure, is now a museum. The American army was disbanded here in 1783, and a victory tower commemorates the termination of the war. Newburgh was incorporated in 1800 and became a city in 1865. Pop. 31,883.

**Newburn.** An urban dist. of Northumberland, England. It is on the Tyne, 6 m. W. of Newcastle, and has a rly. station. The old church of S. Michael was restored in the 19th century. Near is the Roman wall, and Roman remains have been found here. There are coal mines in the vicinity; machinery, tools, glass, and fireclay are made, and there are iron and steel works. Pop. 21,010.

On Aug. 28, 1640, there was a skirmish here. At issue with Charles I, the Scots had sent an army of 25,000 men into England. When they reached Newburn they found the ford there guarded by a body of royalists. After a cannonade, the latter, much inferior in numbers, fled, and the Scots crossed the Tyne.

**Newbury.** Mun. bor. and market town of Berkshire, England. It stands on the Kennet and the Kennet and Avon canal, 17 m. W.S.W. of Reading and 53 m. from London. It is a junction on the rly., and the terminus of a light rly. The church of S. Nicholas was rebuilt by John Smallwood, called Jack of Newbury, who led 150 men to Flodden and died in 1519. The Cloth Hall is now a museum, and there are old almshouses and an old grammar school.

Newbury is the market town for a considerable area. It holds yearly an important market for sheep, while malting, brewing, and milling are carried on. There are establishments for training race-horses. The town includes Speenhamland, and near are Shaw House, an Elizabethan residence, and the remains of Donnington Castle. A borough in the 16th century, Newbury became prosperous owing to the expanding trade in wool, but soon after 1600 this began to decline. The corporation was reformed under the Act of 1835. Market day, Thurs. Pop. 17,490.

**Newbury, BATTLES OF.** Fought during the Civil War, Sept. 20, 1643, and Oct. 27, 1644.

The parliamentary army under the earl of Essex, about 15,000 strong, was returning through Wiltshire to London, after the relief of Gloucester. To cut it off the king arrayed his army at Newbury, while Rupert and the horse-men had skirmishes at Aldbourne Chase and elsewhere. Essex, however, reached Enborne, a village 3 m. from Newbury, and on the downs between this place and Newbury, with the Kennet to the N., the fight took place. It began with a series of royalist attacks, but the London train bands would not give ground, and elsewhere the parliamentarians stood firm against repeated assaults, making good use of hedges. When darkness came on the royalists, their ammunition exhausted, fell back, and Essex, left in possession of the ground, was able to continue his march. The most notable death was that of Lord Falkland.

In Oct., 1644, the royalist army was operating around Oxford, and the parliamentary forces were sent to engage it. They found the king with about 10,000 men near Newbury, with the rivers Kennet and Lambourn in front of him, and on his flank Donnington Castle, one of his strongholds. The plan of the parliamentarians was for a flank attack. One section, after a long circuitous march, carried out its part of the programme by capturing the village of Speen in the rear of the main royalist position, but the others did little, and night fell without a decision being reached.

**Newburyport.** City and port of entry of Massachusetts, U.S.A., the co. seat of Essex co. It stands on the S. bank of the Merrimac river, 37 m. by rly. N.E. of Boston, and is served by the Boston and Maine rly. It has a safe and spacious harbour. Settled in 1635, Newburyport was incorporated in 1764, and became a city in 1851. Pop. 14,815.

**New Caledonia.** French island in the South Seas. It is 1,077 m. from Sydney, is 250 m. long and 35 m. wide, with an area of about 8,500 sq. m. Two parallel ranges cross the island and culminate at 5,570 ft.; the numerous rivers are of little use for navigation. The average annual rainfall is about 40 ins., but much of the island is bare or poor savanna. A fringing reef encircles the island, the inner lagoon being of great use for navigation. There are coffee and cotton plantations, cattle runs, orchards,

and vineyards. Nickel of high quality, cobalt, chrome, coal, gold, and other minerals occur; some ore is smelted at Noumea, and a rly. joins it with Paita, 20 m. away. Native Kanakas are the chief labourers. Pop. 53,245.

Discovered by Capt. Cook in 1774, the island became French in 1853. During 1864-95 it was a penal settlement, and the remaining convicts are now kept in the islet of Nou, opposite Noumea, the capital. The Isle of Pines, Loyalty Islands, Huon Islands, Chesterfield Group, Walpole Island, and Mato Island are dependencies of the island. Surprise Island in the Huon group yields phosphate, and Walpole Island guano. The Wallis archipelago, N.E. of Fiji, and Futuna and Alofi to the S. of this group, are more remote dependencies. The colony is administered by a governor, assisted by a privy council and an elected council-general. On Sept. 10, 1940, the island rallied to the Free French.

**Newcastle.** Market town of co. Limerick, Eire. It is 24 m. S.W. of Limerick. Pop. 2,790. There are a number of other places of this name in Ireland, these including baronies in counties Dublin and Wicklow, and villages in counties Tipperary, Meath, and Galway.

**Newcastle.** Watering-place of co. Down, N. Ireland. It stands on Dundrum Bay, 11 m. S.W. of Downpatrick, and 36 m. by rly. from Belfast. Amid magnificent scenery, it is visited for its bathing and golf. There are no remains of the castle built in the time of Elizabeth.

**Newcastle.** Town of N.S.W., Australia. It stands at the mouth of the Hunter river, 102 m. by rly. N.N.E. of Sydney, on the largest coalfield in Australia. Between the town and Catherine Hill Bay the coal seams are exposed in the sea cliffs. The original settlement followed the discovery by Shortland of coal near the mouth of the Hunter in 1796. Pop. 127,660.

**Newcastle.** Town of Natal, S. Africa. It stands on the Incaud river at the foot of the Drakensberg, 197 m. from Pietermaritzburg and 160 from Durban, with which it is connected by rail. It is the centre of a coal-mining district, has considerable trade in wool and grain, and has iron and steel works, stone quarries, and brickfields. It stands at an alt. of 3,890 ft. The buildings include town hall and public library. During the Boer War of 1880-81 it served as the British base, and here peace was signed. In the S. African War, 1899-1902, its position on the bor-

der of the Transvaal again made it important. The Boers occupied it in their invasion of Natal in Oct., 1899, and it was not regained by the British until June, 1900. Pop. 6,943 (2,900 white).

**New Castle.** City of Pennsylvania, U.S.A., the co. seat of Lawrence co. It stands at the confluence of the Neshannock and Shenango rivers, 49 m. by rly. N.W. of Pittsburg, and is served by the Baltimore and Ohio and other rlys. Its main industry is the making of hotel pottery. Pop. 48,674.

**Newcastle.** The chief town of Northumberland co., New Brunswick, Canada, on the left bank of the Miramichi river, at the head of deep water navigation, 102 m. from Moncton. Centre of a farming, fishing, and hunting district, it has a pop. of 3,781.

**Newcastle, DUKE OF.** British title borne by the family of Pelham-Clinton. It is taken from Newcastle-under-Lyme. The first duke was the soldier, William Cavendish (v.i.), who, in 1665, was made duke of Newcastle-upon-Tyne. His son Henry, the 2nd duke (d. 1691), left no sons, so the title became extinct, but in 1694 it was revived for Henry's son-in-law, John Holles, earl of Clare (d. 1711).

He, too, left no sons, and his estates passed to a nephew, Thomas Pelham, who was made duke of Newcastle-upon-Tyne in 1715, and duke of Newcastle-under-Lyme in 1756. He was the associate of the elder Pitt. When he died in 1768 his earlier dukedom became extinct, but the newer one passed to a nephew, Henry Fiennes Clinton, 9th earl of Lincoln, a title dating from 1572, whose descendants still hold it. Henry, the 5th duke (1811-64), sat in the house of commons as earl of Lincoln, 1832-51. He was first commissioner of woods and forests, 1841-46; chief secretary for Ireland, 1846; secretary for war and the colonies, 1852-54; and for the colonies only, 1859-64. In 1879 Henry (1864-1928) became the 7th duke, and on his death he was succeeded by his brother, till then known as Lord Francis Hope. He died in 1941 and his son, Henry Pelham-Clinton-Hope (born April 8, 1907) became 9th duke. The duke's seat is Clumber, Nottinghamshire. His eldest son is called the earl of Lincoln.

**Newcastle, WILLIAM CAVENDISH, 1st DUKE OF (1592-1676).** English royalist. He was made earl of Newcastle by James I, 1628. A friend of Charles I, he raised troops against the Scots

in 1639, and was tutor to Prince Charles, 1638-41. In 1642 he raised the siege of York, besieged

William Cavendish,  
1st Duke of Newcastle  
After Van Dyck

Leeds, April, 1643, and in June defeated the parliamentarians at Adwalton Moor. A marquess in 1643, he was relieved by Prince Rupert at York, and, after fighting at Marston Moor, left England and lived in poverty in the Netherlands until after the Restoration, 1660. He was recompensed by several royal offices and the dukedom, 1665, and died Dec. 25, 1676. He wrote plays and two works on horsemanship, 1658 and 1667. He married in 1645 Margaret Lucas (d. 1673).

Newcastle-under-Lyme, Staffordshire. The High Street of this N. Staffordshire coal and pottery centre

**Newcastle, THOMAS PELHAM-HOLLES, 1st DUKE OF (1693-1768).** English statesman. Son of Thomas, 1st Lord Pelham, he was born July 21, 1693, educated at Westminster and Cambridge, and succeeded his father in 1712. A supporter of George I's accession, he was made

earl of Clare, 1714, and duke of Newcastle-upon-Tyne, 1715. A rich Whig landowner, in 1724 he joined Walpole's cabinet, and continued to hold office, save during the winter of 1756-57, until superseded by the earl of Bute in 1762. On the death of his brother, Henry Pelham (q.v.), he was first lord of the treasury, 1754-56. Made duke of Newcastle-under-Lyme, he became nominal chief in 1757 of an administration in which "Newcastle said what he liked and Pitt did

Thomas Pelham-Holles, 1st Duke of Newcastle  
After Hoare

what he liked," the latter being war minister, until both were dismissed by George III. Newcastle was lord privy seal under Rockingham, 1765-66, and died Nov. 17, 1768. For a politician of his time he was uncommonly honest. His correspondence with Chesterfield, ed. Sir R. Lodge, appeared in 1930.

**Newcastle Emllyn.** Urban dist. of Carmarthenshire, Wales. It is mainly on the left bank of the Teifi, 9 m. S.E. of Cardigan, with a rly. station. Across the river is Cardiganshire. The ancient Dinas Emllyn, the place was a Roman station, and was called Newcastle-in-Emllyn when a castle was built here. Pop. 762.

**Newcastle - under - Lyme.** Mun. bor. and market town of Staffordshire, England, taking its name from the "new castle"

founded on the Roman *Limes Britannica* in the 12th century. It stands on Lyme Brook and the main London to Liverpool road A6, 16 m. N.N.W. of Stafford, and is served by rly. Buildings include the ancient parish church of S. Giles (fourth on present site); an 18th cent. guildhall; and high

schools for boys and girls. In the borough (enlarged 1932) and immediate neighbourhood are collieries, brick and tile works, and pottery factories; other products include cotton and fustian clothing, paper, and light engineering. Formerly the town was noted for felt hats.

Newcastle was granted to Simon de Montfort in 1265; later the town passed to Edmund Crouchback. Chartered in 1590, it sent two members to parliament from 1353 to 1885, and now has one; it also gives his title to the duke of Newcastle. Philip Astley, circus performer, was born here. Among the regicides in 1649, Harrison was a native and Bradshaw was recorder of Newcastle. Market days, Mon., Fri., Sat. Pop. 63,850.

**Newcastle-upon-Tyne.** River port, city, and co. of itself in Northumberland, England. It is

Newcastle-under-Lyme arms

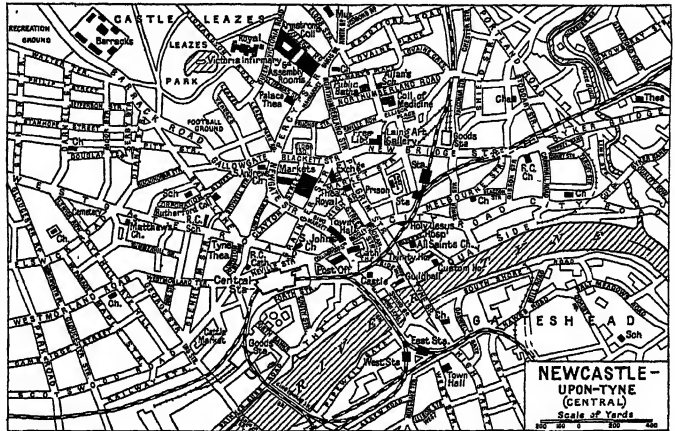

the centre of a large coal mining, shipbuilding, industrial, and agricultural area, and stands 8 m. from the sea, on the N. bank of the Tyne. Geographically it is the natural outlet for much Northumbrian agriculture. To facilitate shipping, the Tyne commission

Newcastle-upon-Tyne arms

undertook from 1861 its great work of deepening and improving the river. Newcastle's main expansion has been to E. and W., owing partly to the transport facilities of the river. Its industries, apart from coal and shipbuilding, include engineering works, electrical works and power distribution, chemicals, grindstones, and the manufacture of lead and of copper alloys. There are markets for corn, hay, and straw, cows, fish, vegetables, etc.

Seven bridges cross the river: Tyne. 1928; High Level, 1846-49; Swing, 1876; Redheugh; Scotswood suspension; Scotswood (rly.); King Edward VII (rly.). Of bridges crossing the valley of the Ouse-

Newcastle-upon-Tyne, Northumberland. Plan of the central districts of the city, including a part of Gateshead

burn, Byker (rly.) and Armstrong Bridges are conspicuous. The Roman bridge, Pons Aelii, was where the swing bridge now is. Open spaces and parks are extensive, e.g. Town Moor (927 acres), Nuns Moor, Castle Leazes, Leazes Park, Exhibition Park, in the N.; Jesmond Dene, Armstrong,

Heaton, and Walker Parks, in the E. and N.E.; Elswick, Hodgkin, and Scotswood Parks, in the W.

S. Nicholas church, a cathedral since 1882 and a bishop's seat, is on the site of a church of 1091, which was rebuilt 1172-78, but burnt down 1216; the rebuilding was completed 1350, and the lantern tower added about 1450. S. Andrew's and S. John's contain parts dating from the 12th century. Other conspicuous churches are All Saints, S. George's, S. Matthew's, and S. Mary's R.C. cathedral. The Great Tower, or keep, of the castle, and the Black Gate, 1247, and its museums, are held by the Society of Antiquaries.

King's College for medicine and science, in the university of Durham, is in the city. Schools include Rutherford grammar and high schools, Heaton grammar and high schools, Royal grammar school, Central high school, Newcastle high school, S. Cuthbert's R.C. grammar school, etc. Music is fostered by the Newcastle and Gateshead choral union, musical tournaments being held annually. The Institute of Mining Engineers, the N.E. Coast Institute of Engineers and Shipbuilders, the Society of Antiquaries, the Classical Association, and the Historical Association watch over other interests. Public libraries contain nearly 300,000 books, MSS., etc.; the art gallery (1904) has loan exhibitions; the Literary and Philosophical Society (1793) has its library, lecture hall, etc., near the central station. Its History, by S. Watson, 1897, illuminates local life. The Royal Victoria Infirmary, 1906, replaces the old infirmary, 1752. Trinity House (hall, chapel, almshouses) is in Trinity Chase, just off Quayside.

Newcastle-upon-Tyne. 1. West front of S. Nicholas cathedral. 2. Grainger Street, the city's principal thoroughfare, with the monument to the 2nd Earl Grey in the centre. 3. Black Gate, the 13th cent. entrance to the castle. 4. The Keep of the castle. See also Bridge illus., p. 1424

Four members are returned to parliament. The chief magistrate has since 1906 been styled lord mayor. The mayoralty dates back to 1216; the shrievalty to 1400. The old government of Newcastle was dissolved in 1835. There are 19 aldermen and 57 councillors.

Newcastle became a point on the Roman Wall when Hadrian in 120 built his bridge (Pons Aelii) and camp. The town had no importance until William I's sons established the fort known from 1080 as the New Castle. The Scots held it during Stephen's reign, but Henry II recovered it, built a castle, the keep of which still remains, and granted a charter. John confirmed the latter in 1201, and added the right to have a merchant guild in 1216. Strong new walls and towers, parts of which still remain, were built in Edward I's reign.

In 1320 Newcastle became the northern staple port for wool. By 1342 the newer trade and craft guilds had won a share in the town's government; fifty years later was established the Fraternity of Trinity House, which lighted and buoyed the Tyne, and exacted shipping dues. By the charter of 1400 Newcastle became a county in itself, and Elizabeth's great charter of 1600 confirmed the old privileges and added new ones. Meanwhile the coal trade, both home and foreign, had greatly expanded. In the Civil War, Newcastle favoured the royalists, and in 1644 was besieged and captured by the Scots. The shipbuilding trade added to Newcastle's prosperity; as also, from the 17th to the late 19th century, did glass-making. Pop. est. 290,730. See Tyne. *Consult* History and Antiquities of Newcastle-upon-Tyne, J. Brand, 1789; History of Newcastle and Gateshead, R. Welford, 3 vols., 1885-87.

**New Church.** Religious denomination which accepts the claim of the Swedish scientist and mystic, Emanuel Swedenborg, that in 1744-45 he was granted insight into the spiritual world by direct revelation. Organized as a society in 1787 by Robert Hindmarsh (1759-1835) of Clerkenwell, it has 75 societies with about 6,700 members in Great Britain, and is represented on the Continent and in the U.S.A. The Bible is interpreted as having both a literal and a spiritual sense; while all things in the material world have their counterpart both in heaven and in hell. "All religion has relation to life; and the life of religion is to do good." Literature is published

by the Swedenborg Society, 20, Bloomsbury Way, London, W.C.1.

**Newchwang** OR YINGKOW. Chinese seaport, in Liaoning prov., Manchuria. Although by the treaty of Tientsin, 1858, a treaty port was created at Newchwang, it was Ying-kow, 14 m. up the river Liao, which became the centre of foreign settlements and to which Europeans generally refer by the name of Newchwang. It is connected with the S. Manchuria rly., linking Mukden and Dairen (Dalny), and with the Pekin-Mukden railway. Ice-bound for three months in the year, it has declined in importance since the opening of Antung and the development of Dairen. Occupied by the Japanese in 1932, it was under the sovereignty of the puppet state of Manchukuo until the conclusion of the China-Japan conflict in 1945. Extraterritorial rights were abrogated by Great Britain and the U.S.A. in 1943. Pop. 82,000.

**New College.** College of Oxford university. It was founded in 1379 by William of Wykeham, as the college of S. Mary of Winchester, but soon became known as New College. It was intended for boys from Winchester College, and this connexion has been maintained, scholarships being still reserved for Winchester. Five fellowships are held by professors known as Wykeham professors. The head is the warden. The college, one of the largest in the university, has a beautiful garden, bounded by the only perfect remaining part of the city wall. There are a large hall, cloisters, and a tower. The fine chapel contains the pastoral staff of the founder and stained glass by Reynolds. New buildings face Holywell Street. The college maintains a choir school, and the rendering of evensong each day during term is celebrated.

New College, Hampstead, a theological training centre for Congregational ministers, is affiliated to London university.

**Newcomb, SIMON** (1835-1909). American astronomer. Born March 12, 1835, in Nova Scotia, he went

Simon Newcomb,  
American  
astronomer

to the U.S.A., 1853, and in 1857 took part in calculating the tables of the American nautical almanac. By 1861 he was professor of mathematics in the navy. He was secretary

of the transit of Venus commission, 1871-74, director of the nautical almanac, 1877-97, and professor of mathematics at Johns Hopkins university, 1884-94. His revision of the lunar and planetary tables resulted in the simplification of nautical almanacs of the world. He received the gold medal of the Royal Astronomical Society, and Copley medal of the Royal Society. His autobiography, *Reminiscences of an Astronomer*, appeared in 1903. He died July 11, 1909.

**Newcomen, THOMAS** (1663-1729). English engineer, born at Dartmouth. About 1705, with financial help from John Colley or Cawley, he constructed an improved form of Savery's steam engine. Newcomen's machine was an atmospheric (steam condensing) pumping engine, and was used about 1710 to raise water from mines near Dudley. It remained the standard model until the improved model of Watt, c. 1765.

**Newcomes, THE.** Novel by W. M. Thackeray, published in 1855, with the full title *The Newcomes*:

New College, Oxford. Front quadrangle, showing, left, the hall and muniment tower

*Memoirs of a Most Respectable Family*, edited by Arthur Penden-nis, Esq. It was issued first in monthly parts, illustrated by Richard Doyle. A study of middle-class social life in the first

half of the 19th century, it includes several autobiographical touches, and has in Colonel Newcome one of the best remembered of Thackeray's characters.

**New Corinth.** Town of Greece. It was founded in 1858, 3 m. from the site of ancient Corinth, destroyed that year by earthquake, and has progressed since the Corinth ship canal was cut through the isthmus in 1893. It has a good harbour, and exports currants. *See Corinth.*

**New Cross.** District of S.E. London. In the bor. of Deptford, it has rly. and underground rly. stations. It is a populous area between Peckham on the W. and Greenwich on the E. New Cross Road connects Old Kent Road with Queen's Road, Peckham, and Deptford Broadway. Near the junction of New Cross Road and Lewisham Way is Goldsmiths' College. For damage during the Second Great War, *see Deptford.*

**New Cut.** Former name of a London thoroughfare, now The Cut. It connects Lambeth Lower Marsh and Waterloo Road with Great Charlotte Street and Blackfriars Road, S.E. Notable for its brokers' shops, street stalls, and Sunday trading, it shared with Lambeth Marsh a somewhat unenviable reputation, dating from the days of Massinger. At the Waterloo Road corner stands the Royal Victoria Hall, formerly the Royal Coburg Theatre. Better known as the Old Vic (*q.v.*), this was damaged and closed during the Second Great War.

**New Deal.** The popular name for the policy of F. D. Roosevelt at the opening of his first term as U.S. president, 1933. He coined it during his election campaign to indicate an attitude rather than any specific plan; it suggested that the "little man" was going to be given more chance. It came to denote a definite legislative programme for each emergency as it arose, with measures for (1) relief, such as the Works Progress Administration and the Social Security Act; (2) recovery, such as the National Recovery Administration and the Agricultural Adjustment Administration; (3) reform, such as the Federal Housing Administration, the National Labour Relations Act, and the T.V.A.

**New Delhi.** Official name for the capital of the Union of India. *See Delhi.*

**Newdigate.** SIR ROGER (1719-1806). English antiquary. Born at Arbury, Warwickshire, May 30,

1719, and educated at Westminster and University College, Oxford, he succeeded his brother as 5th baronet, 1734.

Sir R. Newdigate,  
British antiquary  
After Romney

He was M.P. for Middlesex, 1741-47, and for Oxford university, 1750-80. Sketching in early youth old French and Italian architecture, he afterwards travelled in quest of marbles and other antiquities. He presented some to his college and the Radcliffe library, besides contributing £2,000 for transferring to Oxford the Arundel marbles, now in the university galleries there. He died Nov. 23, 1806.

**Newdigate Prize.** Award for the best poem on a given subject awarded each year to an undergraduate of the university of Oxford. It was founded in 1806 by Sir Roger Newdigate, and is worth 21 gs. Dean Stanley, Ruskin, Matthew Arnold, Sir Edwin Arnold, Wilde, and Laurence Binyon are among those who have won it.

**Newel** (old Fr. *noiel*, kernel). In architecture, term originally denoting the central post or pillar of a spiral staircase. It is now extended to the angle posts in a straight staircase. The newel is a feature of the massive Jacobean staircase, in which it is crowned by a handsomely carved finial or by a statue.

**New England.** Name given to certain N.E. states in the U.S.A., formerly belonging to Great Britain. They are Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut, and their inhabitants, descended from Scottish Presbyterians and English Puritans, are familiarly styled Yankees. The coast was explored in 1583 by Sir Humphrey Gilbert, and in 1614 by Capt. John Smith, to whom the name New England is due. The Plymouth colony was established in 1620 in Massachusetts, and in 1643 a confederacy known as the United Colonies of New England was formed by the federation of New Haven, Connecticut, Massachusetts Bay, and Plymouth colonies, annual and later triennial sessions being held. Area, 63,206 sq. m. Pop. 8,437,290. *See Pilgrim Fathers*, and articles on separate states.

**New England Range** or **NEW ENGLAND PLATEAU.** Mountainous area of Australia, in New South Wales. It is the N.E. section of the

plateau which crosses New South Wales roughly parallel to the coast. The E. face is a steep scarp separated from the Pacific Ocean by a coastal plain; on this side the Clarence, Richmond, and Tweed rivers flow between outlying parts of the plateau, such as the Richmond Range. To the W. the plateau drops in gentler slopes. Ben Lomond and other peaks attain to a height of about 5,000 ft.

**New English Art Club.** British body of painters. Founded in 1885 in opposition to the Royal Academy, it furthered the aims of the younger school of painters at a time when Impressionism was little understood or appreciated in England. Its council was elected by members, of whom Steer, Sickert, and Tonks later became famous. It remained a force in England until the advent of the Post-Impressionists shortly before the First Great War. Though many of the more revolutionary artists joined the London Group during the 1920s and 1930s, the "New English" continued to exert influence.

**Newent.** Market town and parish of Gloucestershire, England. It is 10 m. by rly. N.W. of Gloucester, and has some small manufactures. The church, an old foundation dedicated to S. Mary the Virgin, has been largely rebuilt, but contains old monuments. There are mineral springs. Market day, Tues. Pop. 2,299.

**New Forest.** Woodland dist. and co. constituency of Hants, England. In the S.W. of the co. between Southampton Water and the Avon, it has an area of about 144 sq. m. or 93,000 acres. It is about 16 m. from E. to W. and 14 m. from N. to S. The chief towns therein are Lyndhurst, Brockenhurst, Ringwood, and Minstead. The forest is watered by the Beaulieu and other streams. It contains the ruins of Beaulieu Abbey, and at Stoney Cross is the stone which marks the spot where William Rufus was killed. The chief trees are oak and beech. There are some deer in the forest, which has also a breed of ponies. Brockenhurst and Ringwood have rly. stations.

Much of the land, about 63,000 acres, is the property of the crown, and to look after it there are a surveyor, verderers, and other officials, while forest courts are still held. The creation of the forest is usually ascribed to William the Conqueror, but probably he merely reserved for himself an area already forest. *See Hampshire; consult*

The New Forest, E. Godfrey, 1912; W. F. Rawnsley, 1915; The Commoners' New Forest, F. E. Kenchington, 1944.

**Newfoundland.** A former British dominion, since 1949 a province of Canada. It consists of a large island in the N. Atlantic, off the continent of N. America, with a part of Labrador (*q.v.*). The most N. part of the island is at the straits of Belle Isle, which are about 7 m. wide and divide the island from the mainland. The island is 42,734 sq. m. in area. its maximum length and breadth are both about 320 m., and it is roughly triangular in shape. Larger than Ireland, it is the tenth largest island in the world. From its most E. point to the most W. point of Ireland the distance is 1,640 m. At Heart's Content the Great Eastern landed the Atlantic cable in 1867, and within a few miles of the same point the first

Newfoundland arms

successful air flight (by Alcock and Brown) started across the Atlantic in June, 1919. The pop. is 318,177 (including Labrador).

The coast-line of Newfoundland is much indented, giving it a total length of some 6,000 m. Conception, Trinity, Bonavista, and Notre Dame bays are extensive arms of the sea on the E. and N. coasts; Fortune and Placentia bays on the S. contain between them the Burin pen. Bay of Islands and St. George bay are on the much less broken W. coast, White bay on the N.E., and St. Mary's bay on the S. The islands of St. Pierre (*q.v.*) and Miquelon (*q.v.*), 15 m. off the S. coast, are held by the French.

Most of the hills are near the coast. The Long Range runs for about 200 m. along the W. seaboard. Between these and the coast on the S.W. is the Anguille Range. The range of hills near Bonne bay reaches 2,673 ft. St. John's with a pop. of 62,823 is the capital and the largest town. Other principal towns are Corner Brook (8,713); Grand Falls (7,282); Bell

Island (7,200); Carbonear (4,200); Bonavista (3,636); Twillingate (3,485); Burin (2,335); Grand Bank (2,329); and Harbour Grace (2,065). Placentia was the capital of the part of the island that once belonged to France. Around the coast are many fishing villages.

The town of Grand Falls owes its origin and prosperity to the pulp and paper mills established in 1910 by the Anglo-Newfoundland Development co., created by Viscount Northcliffe and his brother, Viscount Rothermere. Botwood, near the mouth of the Exploits river, is the summer port of the co. Corner Brook, second largest town, was inaugurated in 1923 with the construction of a paper mill; there are also paper and pulp mills at Bishop's Falls. There are trans-Atlantic airports at Botwood and Gander (*q.v.*).

Newfoundland has a remarkable area of fresh water, one-third of its surface being covered with lakes and rivers. The longest rivers are Exploits, Humber, and Gander. The Exploits rises among the hills of the S.W., and, after flowing through wooded country for about 200 m., falls into the bay of Exploits, an opening of Notre Dame bay. On it stands Grand Falls. Thwart I. is the largest of many in its channel. The Humber passes through Deer lake into Bay of Islands. The Gander drains Gander lake on its way to Hamilton Sound, and all around the island less extensive streams run down to the sea. The largest of several lakes is Grand lake, 56 m. long, with an island 22 m. in length.

Compared with that of the interior of Canada, the winter climate of Newfoundland is mild and damp, the Feb. temp. at St. John's averaging 23° F. The influence of the cold Labrador current results in summers which are decidedly cool for these lats.; e.g. in Aug. the average temp. generally does not exceed 60° F. The well-known fogs of the Grand Banks are due to the warm moisture-laden air from the Gulf of Mexico moving over the Arctic Labrador current whose icebergs are carried S. to melt in the warmer water. As the temp. of the tropical air mass may be 30° F. above that of the surface of the polar water, there is pronounced cooling of the lower layers of the air. The resulting fogs, although relatively shallow, extending upwards for a few hundred ft. only, are unusually dense and persistent. The summer and autumn are the foggiest

Newfoundland. Map of this island territory off the continent of N. America, now a part of Canada. Inset, the Labrador coast, the island's former dependency on the mainland

seasons ; during the former months air from the heated adjoining continent also produces fogs over the cold seas. Around the coasts of Newfoundland fogs occur on about 70 days a year ; in the Belle Isle strait, to the N., their average frequency rises to 120.

Newfoundland is first and foremost a fishing country, there being apparently unlimited cod and herring in Newfoundland waters, the most productive area in the W. Atlantic. It has also important paper and wood pulp industries, and also produces iron, lead, zinc, copper, and fluorspar. Value of exports of forest-products in 1945-46 was about £725,000, of minerals nearly £2,000,000. Reserves of iron ore are estimated as 3,500 million tons. In 1945-46 the value of the exports of fishery products was nearly £6,000,000. Besides cod and herring the fish taken included lobster, hake, turbot, haddock, salmon, trout, halibut, and eel. Fishing is carried on around the coasts of the island, on the Labrador coast, and on the Banks—submarine areas 200 m. from the Newfoundland coast—from April to Jan., and on the S. coast of Newfoundland all the year round. The seal fishery—which takes place annually on the ice floes—is valuable ; it was resumed in 1946 after being abandoned 1939-45.

#### Scientific Aid to Fisheries

A govt. research lab. advises on many trade and marine biological subjects. A laboratory research boat operates principally in the vicinity of the Grand Banks. Fourteen govt. bait depots produce nearly 7,000,000 lb. of bait fishes. There are quick freezing and cold storage plants on the coast ; 32 million fresh frozen cod filets were exported in 1946 ; 950,000 quintals of salted cod fish were exported in the same year. Newfoundland is represented on the Atlantic herring investigation committee.

There are 90 registered co-operative organizations, and the govt. assists agricultural societies by importing for distribution pure bred bulls, dairy cows, rams, ewes, and boars. Newfoundland has c. 700,000 acres of first class agricultural land, c. 3,000,000 of second class ; but agriculture is not well developed.

**HISTORY.** Newfoundland was discovered by John Cabot on June 24, 1497, an achievement which earned for him from King Henry VII the sum of £10. In 1498 Cabot made a second expedition to Newfoundland. In 1500 the Portuguese, under Gaspar de Cortereal,

discovered and named Conception bay and Portugal cove. From 1521 Portuguese, Spanish, French, Basque, and English fishermen carried on fishing for cod. In 1527 the first attempt to found a colony was made by Robert Thorne, of Bristol. In 1578 the number of fishing boats using Newfoundland waters had reached 400, of which only 50 were English.

#### Earliest Settlement

On Aug. 5, 1583, Sir Humphrey Gilbert formally annexed Newfoundland to England. The next attempt at colonisation on a large scale was by one Guy, a merchant of Bristol. A patent was granted to the earl of Northumberland, keeper of the privy seal, Sir Laurence Tansfield, baron of the exchequer, and Sir Francis Bacon, incorporating them under the name of treasurers and company of adventurers of the city of London and Bristol for the colony and plantation of Newfoundland. This colonisation by Guy was the first permanent settlement in Newfoundland, and the first settlement by the English in any part of what is now the British Commonwealth.

In 1615 Captain Whitbourne, of Devon, was sent to Newfoundland by the high court of admiralty to correct abuses which had sprung up in connexion with the fisheries. On his return he wrote the first history of Newfoundland. In 1623 Sir George Calvert, afterwards Lord Baltimore, obtained a patent from James I giving him the whole of the pen. of Avalon, and settled at Ferryland, near Cape Race.

In 1626 as many as 150 vessels came from Devon to the Newfoundland fisheries. In 1630 a regular code of laws was issued by Charles I to govern these fisheries, and five years later the French received permission to dry fish along the coasts. In 1650 there were only 2,000 inhabitants in the fifteen harbours then settled. In 1654 further colonists arrived from England, under Sir David Kirke, and in 1660 the town of Placentia was founded by the French. By a regulation of 1663, masters of vessels were prohibited from carrying any settlers to Newfoundland, and merchants doing business there petitioned the king against sending out a governor.

In 1697, under the treaty of Ryswick, the French were left in possession of a considerable settlement on the S.W. coast. In 1713, by the treaty of Utrecht, the whole island was ceded by France to England, but France retained certain fishing rights, out of which

innumerable disputes arose. These were settled by the Anglo-French convention of 1904 under which France renounced her claim to exclusive fishing rights, but retained the right to fish in territorial waters from St. John's cape northward and round Cape Ray.

In 1792 the supreme court of judicature was established in Newfoundland, and in 1809 jurisdiction over Labrador was transferred from Canada to the government of Newfoundland. In 1811 permission was first granted to erect permanent houses, and in 1813 the first grants of land were made by Governor Duckworth. In 1818 a fishery treaty was made with the U.S.A., under which disputes arose. These were settled by arbitration at The Hague, in 1910, Great Britain securing the right to make fishing regulations without consulting the U.S.A. and also the confirmation of her contention that the whole extent of a bay from headland to headland is territorial waters.

#### Constitution and Government

Newfoundland was first granted representative government in 1832, and responsible government in 1855 by a constitution under which administration was by a crown-appointed governor and an executive council responsible to an elected legislative assembly of 27 and a legislative council of 24 nominated by the governor for life. 1865 saw the first geological survey of the island. In 1869 took place an election, by which the party favouring confederation with Canada was defeated by a very large majority at the polls. In 1871 the garrison of British troops was withdrawn from Newfoundland. In 1880 took place the turning of the sod for the first railway, E. to W., which, by the addition of various branches, now extends over 1,000 m. At the W. terminus of the route is Port aux Basques, 60 m. from Sydney, on Cape Breton island ; fast steamers connect the terminus with that port.

In 1925 suffrage was extended to women of 21 years and upwards. In 1933 Newfoundland's financial situation had become critical. A royal commission of investigation appointed by the U.K. government recommended that the constitution be suspended ; and this was done by an Act of the U.K. parliament, 1933. From Feb. 15, 1934, to April 1, 1949, the territory was administered by a governor assisted by a commission of six crown-appointed members, three from Newfoundland, three

from the U.K. An elected national convention met in 1946 to make recommendations about future forms of government. These were submitted in 1948 to a referendum, which gave a majority of 6,556 in favour of confederation with Canada. On April 1, 1949, Newfoundland duly became a Canadian province. Constitutional government under a lieutenant-governor was restored. The province sends six senators and seven members of the house of commons to the Canadian parliament.

Newfoundland gave generously in men and money during the two Great Wars. In the First, nearly 12,000 men enlisted in the British forces, besides 3,000 who joined the Canadian army; the Royal Newfoundland regt. fought at Gallipoli and in France. In the Second Great War, two artillery units were recruited as part of the British army; one served with distinction in N. Africa and Italy; the other fought on the western front, being the first heavy regt. to cross the Rhine. Three thousand Newfoundlanders joined the Royal Navy, more than a thousand the merchant navy; others served with the British and Canadian air forces; it was estimated that more than a quarter of the male population of military age saw service abroad. More than 500 women enlisted in the Canadian forces. A forestry corps was raised in both wars and rendered valuable service in Great Britain.

In November, 1940, began the development of Newfoundland as the western terminus of the Atlantic air ferry; a huge airport was developed at Gander, from which aircraft were flown from U.S. and Canadian factories direct to Great Britain; after the war Gander became a staging point on the regular trans-Atlantic route. Sites in Newfoundland were granted on a 99-year lease to the U.S.A. in Jan., 1941, under the British-U.S. agreement of Sept., 1940, for development as air and naval bases, and the presence in the island during the Second Great War of large U.S. forces brought it a prosperity it had never known before. *Pron.* Newfoundland.

Saunders and Eleanor Back, 1943; Newfoundland, the Forgotten Island, Ammon, 1944; Outlines of Geography, Life and Customs of Newfoundland-Labrador, V. Tanner, 1944; Atlantic Bridge, Official Account of R.A.F. Transport Command's Ocean Ferry, 1945; History and Economy of Newfoundland, R. A. McKay,

1946; Report on the Financial and Economic Position of Newfoundland, 1946. Histories: C. Pedley, 1863; D. W. Prowse, 1897.

**Newfoundland Dog.** Large, handsome, and intelligent breed of dog. First introduced to Great

Newfoundland Dog. Champion Gipsy, a prize specimen of the breed

Britain from Newfoundland in the 18th century, the breed has been further improved, and the conservation of its good points by breeders is looked after by the Newfoundland Club, whose influence has been mostly in favour of a dog wholly black, save for a patch of white, perhaps, on the chest and toes. Probably the original colour was white with black head, black saddle mark, and black at the base of the tail. According to the standard fixed by the club, the average height at shoulders is 27 ins. for a dog, and 25 ins. for a bitch; but many specimens are larger.

The Newfoundland's coat is flat and dense, rather coarse and oily, and falls back into position when disarranged. The forelegs are straight and muscular, the feet large and well shaped. The tail, which reaches below the hocks, is thick, covered with long hair, and slightly curved at the tip. Ears and eyes are small, the latter of dark brown colour. His disposition is tractable and affectionate, especially with children.

The lesser Newfoundland or Labrador dog is all black. From it has sprung by intercrossing the curly-haired black retriever (*q.v.*). See Dog colour plate.

Newgate, London. The old gaol, from the church of S. Sepulchre, showing corner of Newgate Street and the Old Bailey, from a print of 1800. Top, right, New Gate, a 17th century view of the City gate, which once served as a prison

**Newfoundland Regiment, ROYAL.** Regiment recruited in Newfoundland in 1914, which served in Gallipoli and France. It was granted the prefix Royal in 1918, and disbanded in 1919. In 1940, another Newfoundland unit, the 166th (Newfoundland) Field Regiment, Royal Artillery, was raised in the Dominion for service in the Second Great War. It went to N. Africa in 1943 and served throughout the Tunisian campaign and in Italy, France, and Germany. It was disbanded in 1946.

Newfoundland Regiment badge

**Newgate.** Former gaol in the city of London. A gaol stood on the same site for almost 1,000 years, and records go back to the time of King John. The prison was then in the gate house, *i.e.* New Gate, as was the rule in medieval times.

A new prison was begun in 1420, burnt down in 1666, rebuilt upon the same lines, and again rebuilt 1778-80, only to be partly destroyed by fire during the Gordon Riots, 1780. Reconstructed in 1857, the gaol was taken over by the government from the city authorities in 1877; three years

later it ceased to be a place of detention, and in 1903-04 was demolished, its site being now occupied by the Central Criminal Court.

In 1783 the public gallows were removed from Tyburn to the outside of Newgate, and there executions took place until 1868, when an Act ordered all

hangings to be carried out within the walls of prisons. The last man to be hanged in front of Newgate was the Fenian, Michael Barrett, May 26, 1868, and the last criminals executed within its walls were Milsom and Fowler, 1896. Vast crowds assembled to see the executions, and large sums were paid for seats. See Central Criminal Court; Old Bailey; consult *Chronicles of Newgate*, A. Griffith, 1884; *Trials from the Newgate Calendar*, 1907.

**New Glasgow.** Town of Nova Scotia, Canada. It stands on the East river, 105 m. N.E. of Halifax, and 3 m. from the coast at Pictou Harbour. There are large coal mines in the neighbourhood, and the industries include iron and steel works, a car company, and works for making bricks, tools, etc. A branch line of the C.N.R. carries the coal for export to Pictou Landing. Pop. 9,210.

**New Goa or PANJIM.** Capital of the Portuguese possessions in India. Known also as Nova Goa, it is the seat of an R.C. archbishop, and is on the W. coast of the Deccan. Pop. 7,500.

**Newgrange Monuments.** A Bronze-age cemetery of 17 grave-mounds in the Boyne valley, co. Meath, Eire. At Newgrange a round cairn, 315 ft. across, 70 ft. high, has a megalithic retaining wall, and a stone circle of 12—once 30—menhirs. A 63-ft. gallery leads to a corbelled chamber with three side-cells. Spiral and other designs suggest Aegean influence; some probably represent a female divinity. See *Maeshowe*.

**New Guinea.** An island of the Pacific Ocean. Situated just south of the equator, it lies in the East Indian archipelago and belongs physically to the islands which festoon the N.E. coast of Australia, from which New Guinea is separated by Torres strait. Covering an estimated area of 311,000 sq. m., the island consists of central and northern mountain ranges with lower hill country to the S. and alluvial valleys on the coasts. Some of the mountains have glaciers, Mt. Carstens (16,400 ft.), the highest point on the island, having two. The country is very rugged, with thick scrub and jungle. The tropical climate makes the island generally unhealthy for Europeans. Except in the immediate vicinity of the larger towns there are few roads; there are only foot-tracks in the interior. There are no rlys., the principal means of communication between the towns, which are

mostly on the coast, being by sea. The Fly river is navigable for 500 m. by small vessels.

Although the flora and fauna are distinctly Australian in type, the native pop. is neither Asiatic nor Australian, but akin to the Melanesians of the neighbouring South Sea is. The native pop. is estimated at 1,178,458, and there are 8,587 Europeans and some 2,000 Chinese. Coconuts, rubber, sisal, and cotton are produced and exported, and there are deposits of copper and gold, barely exploited.

Politically, New Guinea is divided into two main divisions, the eastern half being British, the western half Dutch. The British

Australian administrator of Papua and appointed by the gov.-gen. of Australia.

Under European rule, many of the former savage and head-hunting tribes have settled down to peaceful pursuits on the coconut and rubber plantations, 63,500 acres of which are normally under cultivation. Papuan exports to Australia enjoy a preferential tariff, and to encourage local industry natives are obliged to plant their lands or establish communal plantations. Education is compulsory for native children where English-speaking schools are available, and a family bonus is paid to native mothers. Internal

New Guinea. Map of the largest island in the East Indian Archipelago

area is in two parts; British New Guinea (or Papua) in the S.E., and N.E. New Guinea, held by Australia under U.N. trusteeship.

British New Guinea or Papua includes the islands of the d'Entrecasteaux and Louisiade groups and all other islands between lat. 8° and 12° S. and long. 140° and 155° E. It has an area of 90,500 sq. m., including the adjacent islands, 2,754 sq. m., pop. 301,500 (1,500 European). The annexation of Papua by the govt. of Queensland in 1883 was not sanctioned by the British govt. Next year, however, a British protectorate was proclaimed, and in 1887 the govts. of Queensland, Victoria, and New South Wales undertook to defray administrative costs; the following year Papua was annexed to the crown. The Australian federal govt. took over control in 1901, and the territory of Papua was proclaimed in 1906. Local government is by an executive council of five to nine members, one of whom is chosen from the non-official members of the legislative council, nominated by the

expenditure is met from local revenue, chiefly from a poll tax, assisted by a subsidy from the Australian govt. The principal towns and ports are Port Moresby, Samarai, Kulumadai, and Daru. There is a monthly steamer service, and a twice-weekly air service from Australia.

Australian-governed New Guinea was acquired by Germany in 1884 and named Kaiser Wilhelmsland. The territory has an area of 93,000 sq. m. and an estimated present pop. of 672,958 (4,087 European). The Germans did little to exploit the country's natural resources, and did not explore far into the interior. The territory was occupied by Australian troops in Sept., 1914, and was mandated to Australia by the League of Nations in Dec., 1920. Many of the tribes remain outside official control. Coconuts are the staple product, but there is little trade or industry. Rabaul, New Britain, capital of the mandated area until the Japanese invasion in 1942, was so badly damaged during the Second Great War that it was decided in 1946 not to rebuild it.

After the Japanese invasion early in 1942, civil administration in Papua and Mandated New Guinea was suspended and government transferred to the Australian military forces. In Oct., 1945, the territories were temporarily transferred to the control of a provisional administration of Papua and New Guinea pending a decision as to the future administration of the mandated territory. In Aug., 1946, the United Nations placed the mandated territory under the trusteeship of Australia, and permitted that country to undertake any defensive measures necessary for its protection. The trusteeship agreement also established Australia's right to bring the territory into a customs or administrative union with other Australian-controlled territories.

**NETHERLANDS NEW GUINEA.** This comprises more than half the main island, and includes the Schouten Is. at the entrance to Geelvink bay. A treaty between Holland and England in 1660 gave the Dutch East India co. rather vague rights over the territory, to which the Dutch govt. succeeded, and Dutch sovereignty was admitted by the British in the convention of 1814. The coast was mapped with fair accuracy by A. R. Wallace and others during the 19th century. The interior has not been fully explored, though military operations in the Second Great War led to extensive journeyings in it. Mountains that have been named include the Arfak, Orange, Nassau, and Charles Louis ranges; the lower courses of the rivers Mamberano, Digul, Merauke, etc., are known, and close to Santani lake, scarcely known before, the Japanese constructed two airfields.

Much of the area is virgin jungle. The natives cultivate rice, sugar-cane, maize, and yams, but there is virtually no commerce or industry; the people generally live in a wild state. Marsupials, birds of paradise, emus, and trepang are typical fauna. Except in the vicinity of the Dutch settlements, of which Hollandia (developed by the Americans during the Second Great War), Merauke, Kaimana, Kokas, and Fakfak are the principal, there are no roads.

Netherlands New Guinea was administered from The Hague after the Second Great War; plans were made for the immigration of displaced Indonesian-Dutch from Indonesia in order to develop the agricultural and mineral resources

of the country; coal has been found. Area, 151,789 sq. m. Pop. (est.) 195,000 (3,000 European).

**SECOND GREAT WAR.** New Guinea was a main objective of the Japanese in the Second Great War as a base from which to invade Australia. Under the terms of the mandate, Australia was not allowed to fortify the mandated area. Japan occupied Rabaul (New Britain) and Kavieng (New Ireland) on Jan. 23. Using Rabaul as a base, Japanese landed on New Guinea on March 8 at Lae and Salamaua, and two days later at Finschhafen. An intended assault on Port Moresby was prevented by the naval battle of the Coral Sea (*q.v.*) in May. On July 21, however, some 2,500 Japanese landed at Gona on the N.E. coast of Papua and immediately began to advance across the Owen Stanley range towards Port Moresby, which they had frequently bombed.

#### Japanese Threat to Australia

The town was garrisoned by the Australian 6th and 7th infantry divs. A small Australian detachment stationed at Kokoda on the N.E. side of the range, the first to make contact with the enemy, fought a gallant delaying action; but it was almost impossible to reinforce the advance troops along the primitive tracks leading through the range, and by Sept. 15 the Australians were driven back to the Iorabaiwa Ridge, 32 m. from Port Moresby and the last defensive position before that town.

Meanwhile, another Japanese landing on Aug. 25 at Gili Gili, at the head of Milne bay in the S.E. of the island, had been beaten off, after four days' bitter fighting, by the R.A.A.F. and Australian infantry.

The difficulties in terrain which had prevented reinforcement of the Australians now told against the Japanese; and on Sept. 30 they were forced back from Iorabaiwa Ridge, the Australians launching a counter offensive with U.S.A.A.F. support which recaptured Kokoda on Nov. 2 after protracted and bitter fighting, and drove the Japanese from Gona on Dec. 9, from Buna Dec. 14.

These operations removed the immediate danger to Australia; they were also the first major defeat of the Japanese in jungle fighting, and ended the myth of their invincibility in this type of warfare. By Jan. 23, 1943, the Australians had completely cleared the enemy from Papua, and were advancing into the mandated

territory, where the Japanese held strong bases at Lae and Salamaua and many local positions. During Jan. there was a violent battle for Wau (administrative h.q. of the Morobe goldfields), which had remained in Australian hands, and the Japanese were repulsed. A Japanese convoy carrying 15,000 men to New Guinea was destroyed in the battle of the Bismarck Sea, March 1-3, and other reinforcements were continually intercepted, while Australian ground forces steadily pushed the Japanese back on Salamaua.

On June 30 U.S. troops landed at Nassau Bay, 11 m. S. of Salamaua, making contact with the Australians at Mubo, captured July 15. By Aug. 9 the Australians had captured Kela Ridge, overlooking Salamaua. On Sept. 4, Australian and U.S. troops landed at Lae; while U.S. parachutists, watched by Gen. MacArthur, landed in the Markham valley on the 5th and 6th. Salamaua was captured on Sept. 14, Lae two days later. On Sept. 22, new Allied amphibian landings were made near Finschhafen, captured by the Australian 9th infantry div. Oct. 2. With the capture of the airfields in this area, Allied control of Huon Gulf and the Vitiaz strait (between New Guinea and New Britain) was assured. Australian troops captured the 4,827 ft. Sattelberg on Nov. 26 and then began an advance along the coast, meeting at Vagomai on Feb. 11, 1944, U.S. troops who had landed at Saidor on Jan. 2.

#### Allied Victories

Other Australian troops had meanwhile been driving the Japanese from the Markham and Ramu valleys into the Finisterre range, which they crossed against fierce enemy resistance in Dec., 1943, to capture Bogadjim, April 14, Madang, April 24. Allied landings on April 22 at Aitape in mandated territory and in the Humboldt bay area in Netherlands New Guinea split the Japanese into sections. In mid-July one strong group trapped between Aitape and Wewak attempted to break through to the coast, but was repulsed with heavy loss and driven back into the mts. Wewak itself was not captured until May 14, 1945, its harbour falling only on June 5.

The landing on April 22, 1944, by U.S. and Netherlands troops at Hollandia on Humboldt bay was followed by the capture of Hollandia (then a village) next day, of the Japanese airfields near Lake Santani on the 25th, and of

Hollandia airfield on the 27th. Netherlands civil administration was at once restored and extended as further areas were retaken. U.S. troops made new landings at Torare bay and Dempta on May 5, on Wakde I. and at Arara on May 17. Wakde was secured by the 19th; its good airstrip gave the Allies command of Geelvink bay, and on May 27 a U.S. force invaded Biak, one of the Schouten Is., where there was a fierce tank battle for the Mokmer airfield, captured on June 7. Biak was cleared, except for a few isolated groups of Japanese, by June 20. Noemfoor I. was seized July 1, and on July 30 the Allies landed at Cape Sansapor, near the western tip of New Guinea, the islands of Amsterdam and Middelburg being seized at the same time. The Japanese garrison by-passed at Manokwari surrendered only after the Allied occupation of Morotai on Sept. 17. There were no further major operations in Netherlands New Guinea.

The Japanese ceased fire in New Guinea, Aug. 22, 1945, Lt.-Gen. Adachi commanding the Japanese 8th army there surrendering at Wewak, Sept. 13, to Maj.-Gen. Robertson, commanding the Australian 6th div. See Pacific War. *Consult* New Guinea Gold, E. Demaitre, 1938; A Letter from N.G., V. Haugland, 1944; New Guinea Diary, G. H. Johnston, 1944; New Guinea Head-hunt, C. Mytengen, 1947.

**New Hampshire.** State of the U.S.A. It has a 19-m. stretch of coast on the Atlantic, and is bounded N. by Quebec, Canada, E. by Maine, S. by Massachusetts, W. by Vermont. One of the 13 original states, it has an area of 9,304 sq. m. Its uneven surface attains an alt. of 6,288 ft. in Mt. Washington, one of several peaks of the White Mts. which exceed 5,000 ft. These mts. form one system with the Franconia and Sandwich Mts., and include the highest points of the N.E. Appalachians. In this area are some leading skiing resorts.

The "granite state" is drained chiefly by the Merrimac in the centre, Androscoggin in the N., Connecticut on the W. frontier, Piscataqua on the S.E. border, and the Saco. These streams provide abundant water power for industry. There are some 1,300 lakes, the largest being Winnepesaukee. Agriculture, once the premier industry but now second to manufacturing, yields chiefly dairy products, livestock, and

poultry. Hay, maize, potatoes, oats, and fruit are cultivated. Manufactures include boots and shoes, cotton and woollen goods, paper and pulp, lumber, iron and steel products. Mica, feldspar, and beryllium occur. Three rlys. with a mileage of 1,086 serve the state. At Durham is the state university, founded 1866. Two senators and two representatives are sent to congress. Concord (the capital) is a smaller city than Manchester and Nashua. Pop. est. 457,000.

The first settlement was made in 1623, where Rye now stands. The district was part of a grant of land made to John Mason and named after his home county, Hampshire; other settlements had been planted, and a dispute began between the company of Massachusetts and Mason's heirs over the boundary. Charles II made New Hampshire a separate province in 1679, but up to the outbreak of the War of Independence disputes with Massachusetts continued. New Hampshire was the first colony in 1776 to establish a government independent of Great Britain. *Consult* History of N.H., H. H. Metcalf, 1926.

**New Harmony.** Market town of Indiana, U.S.A., in Posey co. It stands on the Wabash, on the Illinois border, 17 m. N.N.W. of Mount Vernon, and is served by rly. It was settled in 1814 by a German community of religious socialists known as New Harmonists, from whom it was acquired in 1824 by Robert Owen for a socialist experiment. After the Civil War it was visited by Audubon, the ornithologist, and Lyell, the geologist. During 1839-56 it was the h.q. of the U.S. geological survey. Pop. 1,390.

**Newhaven.** Seaport and urban dist. of Sussex, England. It stands at the mouth of the Ouse, which

divides the town, about 9 m. E. of Brighton, and has two rly. stations, town and harbour. The chief building is S. Michael's church, with Norman tower and chancel, restored and enlarged in the 19th century. Newhaven has a good harbour,

Newhaven arms

covering about 30 acres, whence steamers go regularly to Dieppe and other ports, carrying passengers and goods. There is a coasting trade, while shipbuilding is an industry. Off the port is one of the best roadsteads of the S. coast. Fishing and bathing are available.

Formerly known as Meeching, Newhaven received its present name when the harbour was begun soon after 1710. It soon became a prosperous port, and, after a period of decay, revived in the 19th century. Pop. 7,047.

**Newhaven.** Seaport of Midlothian, Scotland, since 1920 included in the city of Edinburgh. It stands on the S. side of the Firth of Forth, 2 m. N. of Edinburgh with a rly. station. It received its name from the harbour built here about 1490. Fishing is the principal industry.

**New Haven.** City of Connecticut, U.S.A., co. seat of New Haven co., second largest city, and chief seaport, of the state. It stands at the head of New Haven Bay, 4 m. from Long Island Sound, 70 m. N.E. of New York, on the New York, New Haven, and Hartford rly. (the yards of which here cover 900 acres), and has a municipal airport. The Quinnipiac, Mill, and West Rivers flow into the bay, and the port, formerly a whaling centre, receives coal, petroleum, and lumber, but ships little. New Haven is the seat of

Newhaven, Sussex, showing the harbour used for daily cross-Channel traffic

Yale university, Hopkins grammar school, Albertus Magnus college for women, and Arnold college.

Picturesque New Haven has a 16-acre green on which stand three notable churches built about 1815 (one inspired by S. Martin-in-the-Fields, London, England). Here are Yale university buildings and others of architectural or historic interest. The city makes hardware, electrical equipment, ammunition and firearms, clocks, packed meats, and cutlery.

A party of Puritans settled here in 1638, and established a theocratic community which was first called Quinnipiac, the name being changed in honour of New-haven, Sussex, in 1640. The New Haven colony, augmented by other towns, was absorbed by the Connecticut colony in 1664. Captured and sacked by the British in 1779, New Haven was the joint capital of the state from 1701 to 1873, and was chartered as a city in 1784. Pop. 160,605.

**New Hebrides.** Group of islands in the Pacific Ocean. They lie between Santa Cruz Islands on the N. and the Loyalty Islands on the S., the Fiji Islands being on the E., and the Coral Sea on the W. The parallel of 15° S. crosses them. The principal islands of some 30 are Espiritu Santo, Malekula, Epi, Efate or Sandwich, Erromanga, Tanna, Aneityum, and Ambrym, and all are administered by British and French officials under the Anglo-French convention of 1906.

Wooded or covered with luxuriant vegetation, many of volcanic origin, some of the islands are mountainous with a moist, unhealthy climate. They produce copra, bananas, sugar cane, sago, rubber, tortoiseshell, sandalwood, and coffee. The import of ammunition and the import and distillation of spirits are prohibited. There are R.C. and Presbyterian missions on the islands, but cannibalism is not extinct. Trade is mostly with Sydney and New Caledonia. Discovered by Quiros in 1606, the islands were visited and named by Cook in 1774. The French in this condominium were the first to declare for De Gaulle, July 20, 1940. The area is about 5,700 sq. m., and the pop., chiefly Melanesian, is est. at 41,000.

**New Iberia.** City of Louisiana, U.S.A., the capital of Iberia co. It stands on the Bayou Teche, at the head of its navigation, 130 m. W. of New Orleans, and is served by rlys. Manufactures include foundry and machine-shop products, railway wagons, and soap.

Sugar, cereals, and fruits are cultivated locally, and salt is also obtained. New Iberia was settled by Spaniards in 1785, occupied by the British in 1816, and became a city in 1839. Pop. 13,747.

**Newington.** Name of a parish of the London bor. of Southwark, and of several other parishes in England. That on the Thame, 9 m. S.E. of Oxford, contains an ancient church, S. Giles's, with a 14th century tomb. Newington, Kent, 8 m. E. of Rochester, also has an old church, S. Mary's, a Decorated flint structure, with lofty Perp. west tower. At South Newington, a village 6 m. S.W. of Banbury, Oxon, the church of S. Peter contains some notable Norman, E.E., and Perp. work. See Southwark.

**Newington Butts.** London thoroughfare. Linking Kennington Park Road with Newington Causeway, Southwark, S.E., it contained the Metropolitan (Spurgeon's) Tabernacle, built 1860-61, rebuilt 1898, and destroyed by German bombs in the Second Great War; the memorial clock-tower and churchyard of S. Mary, Newington, a church demolished in 1876; and still has the modernised Elephant and Castle inn, once a coaching rendezvous. This gives its name to a congested road junction and the terminus of the Bakerloo rly. Near the inn Joanna Southcott (q.v.) set up a meeting-house. The name Newington Butts is derived from an old archery ground, and from that of a family once owning an estate here.

**New Ireland.** Island of the Bismarck Archipelago (q.v.). It is separated from New Britain by St. George's Channel. Long and very narrow, it is mountainous in the S. and level in the E. There are extensive forests, but the climate is unhealthy. The natives are a type of Melanesians. As Neu Mecklenburg, it was part of a German protectorate until 1914. Australia governed it from 1921 under mandate and trusteeship. Kavieng is the chief town and Nusa the harbour. Before attacking New Guinea in 1942 the Japanese wanted to obtain bases close to that island, and having bombed Kavieng, occupied it on Jan. 23. Though the town was bombed and shelled on several occasions, no landings were made by the Allies. Area, 3,800 sq. m. Pop. 37,394. See New Guinea.

**New Jersey.** Middle Atlantic state of the U.S.A. and one of the 13 original states. It has an area of 7,836 sq. m., but despite this

comparatively small size ranks ninth by pop., with 4,160,165. The surface in the N. is crossed by ridges and mts. of the Appalachian system, the centre is generally level, and the S. slopes towards a coastal plain, where resorts like Atlantic City attract thousands of visitors. Important rivers include the Delaware, Hudson, Passaic, Raritan, and Hackensack. Manufacturing centres are Paterson, Elizabeth, Bayonne, and Hoboken. Notable for the diversity of its industries, New Jersey has petroleum refining, copper smelting, ship-building, fruit canning, meat packing, and makes electrical machinery, chemicals, paints, varnishes, and dyestuffs. It ranks second in zinc production, while iron ore is plentiful. Agriculture and forestry flourish, while the proximity of New York has been responsible for the development of market gardening. Eight rly. systems cover 2,132 m. Newark airport is one of the world's largest.

Two senators and 14 representatives are sent to congress. The capital is Trenton, but Newark and Jersey City are much bigger. Educational institutions include Princeton, Rutgers, Newark, and Drew universities. Morristown national historical park (958 acres) contains the site of the base hospital of the American army during the Revolution and of its main camp during the winter of 1776-77 and 1779-80.

The first settlers were Dutch who arrived about 1620. The Swedes followed, but in 1655 their settlements passed to the former. During the Dutch Wars the English took possession of the district, and the name of New Jersey was given because one of those to whom the land was granted by the duke of York was Sir George Carteret, the former governor of Jersey. Later part of the territory came under the control of the Society of Friends, including Penn. In 1702 E. and W. Jersey were placed under the same governor and united as a crown colony until the outbreak of the War of Independence, in which New Jersey was the scene of 100 battles and skirmishes. Consult The Story of New Jersey, W. S. Myers, 1945.

**New London.** City and port of entry of Connecticut, U.S.A., and a co. seat of New London co. It stands on the Thames R., 3 m. above Long Island sound, 50 m. E. of New Haven, and is served by several rlys., by steamer, and by Groton airport. The harbour is one of the deepest on the Atlantic

coast; a shipbuilding centre from the 18th cent., it sheltered many privateers during the Revolution. In the 19th cent. it had a whaling fleet. An industrial centre, the city exports motor cars and imports lumber. It is the seat of the U.S. Coast Guard academy; while Groton (pop. 4,719) on the opposite bank of the Thames is the U.S. navy's Atlantic submarine h.q. A summer resort and yachting centre, New London is the scene of the annual Harvard-Yale boat race. Educational institutions include the Connecticut College for women. The city, first settled 1646, was incorporated 1784. Pop. 30,456.

**Newlyn.** A fishing village on Mounts Bay, 2 m. S.W. of Penzance, Cornwall, England. Its situation has made it a resort of artists, but it is also a fishing centre, with a good harbour protected by huge granite piers. Pilchards and mackerel are caught. The church is dedicated to S. Peter.

Newlyn. The harbour of this small Cornish fishing village

Newlyn has been part of the bor. of Penzance (*q.v.*) since 1934. Pop. est. 5,000.

**Newlyn School.** Colony of British artists settled about 1880 at Newlyn, Cornwall. The aim was to encourage work in the open air, and a fidelity to everyday life among the Cornish fishing folk. Pioneers of the colony included Walter Langley, H. S. Tuke, Edwin Harris, and Stanhope Forbes, whose topographical studies of the neighbourhood influenced many students. After the original impetus of the group had declined Newlyn continued to attract artists, possibly because of the unusual studio facilities. Later painters to work there included for a time Ernest and Dod Procter and Harold and (Dame) Laura Knight.

**Newmains.** Town of Lanarkshire, Scotland. It stands on the coalfield, 2 miles E. of Wishaw. The chief occupations are in the coal mines, the Coltness ironworks, and the Morningside brickworks. Pop. 7,000.

**Newman, ERNEST** (b. 1868). A British music critic. Born Nov. 30, 1868, he was educated at Liverpool university, and after abandoning a career as Indian civil servant, joined the staff of Midland institute at Birmingham in 1903. Two years later he became music critic to the Manchester Guardian, and in 1906 to the Birmingham Post, resigning in 1919 when he settled in London. As critic to the Sunday Times he became one of the most incisive

Ernest Newman, British music critic

writers on music of his day. He wrote extensively on Wagner, *e.g.* *A Study of Wagner*, 1899; *Wagner as Man and Artist*, 1914 (revised ed. 1924); *Facts and Fiction about Wagner*, 1931; and *a Life in 4 vols.* (1933, 1937, 1944, and 1946). He also translated a number of Wagner's librettos for the Breitkopf and Hartel edition. Newman's other publications on music included Gluck and the Opera, 1895; Elgar, 1906; Hugo Wolf, 1907; Richard Strauss, 1908; *The Unconscious Beethoven*, 1927; *The Man Liszt*, 1934; *Opera Nights*, 1943.

**Newman, JOHN HENRY** (1801-90). British theologian and cardinal. He was born in London, Feb. 21, 1801, and educated at Trinity College, Oxford, becoming in 1822 a fellow of Oriel. In 1828 he became vicar of S. Mary's, Oxford, having been in the meantime for a short period vice-principal of S. Alban's Hall.

In 1833, in conjunction with Hurrell, Froude and others, he began the publication of the *Tracts for the Times*, which inaugurated the Tractarian or Oxford movement. In the pulpit of the university church Newman was now

preaching sermons which attracted wide attention by their literary perfection, dialectical skill, and devotional tone, combined with the evident sincerity and the personal charm of the preacher. He thus exercised an almost unique influence on the younger thought of Oxford, and indirectly on the Church generally. In 1841 he published *Tract XC*, in which he argued that the 39 Articles were capable of an interpretation very different from the Protestant one usually accepted. This roused indignation, and in the following year he retired to Littlemore, and resigned the living of S. Mary's.

In 1845 Newman was received into the Roman Church, and went a year later to Rome, where he was ordained priest and made a D.D. Returning to England in 1847, he settled at Edgbaston, where he founded a congregation of the Oratory. He established the London

John Henry Newman, British cardinal

Oratory in 1850, and in 1854 became rector of the R.C. university at Dublin. During the following four years he published his *Idea of a University* and his *Lectures on University Subjects*. A controversy with Charles Kingsley resulted in his autobiographical *Apologia pro Vita Sua*, 1864, giving with candour and sincerity his reasons for becoming an R.C. In 1879 he was made cardinal. He lived in retirement at Birmingham until his death, Aug. 11, 1890.

Newman was recognized as one of the most acute thinkers of his day, and his literary style has rarely been surpassed for beauty and clarity. As a preacher he stood in the first rank, and the influence of his writings has yet to be fully estimated. His dialectical skill was unrivalled; but it was often overwhelming rather than convincing. His hymn, *Lead, Kindly Light*, and his poem, *The Dream of Gerontius*, achieved wide popularity. See *Oxford Movement*.

**Bibliography.** Letters and Correspondence, ed. A. Mozley, 1891; *The Oxford Movement*, R. W. Church, 1891; *The Anglican Career of Cardinal Newman*, E. A. Abbott, 1892; *Lives*, R. H. Hutton, 1891; W. Barry, 1904; C. G. Atkins, 1931; W. Ward, 1937; J. Moody, 1946; Newman, Faith and the Believer, P. Flanagan, 1947; Young Mr. Newman, M. Ward, 1948.

**Newman Prize.** Naval prize founded in memory of Edward Newman, R.N., one-time chief engineer of Portsmouth dockyard. From the interest upon £400 a prize of books or scientific instruments is awarded annually to the lieutenant (E.) who obtains first place in practical engineering at the Royal Naval engineering college, Devonport.

**Newmarch, WILLIAM** (1820-82). British statistician. Born Jan. 28, 1820, at Thirsk, he entered a bank, and then an insurance office in London. During 1862-81 he held a high position in the banking house of Glyn, Mills and Co. He died March 23, 1882. Newmarch did a great deal of work for the Royal Statistical Society, and he assisted T. Tooke in writing a standard work, *The History of Prices*. The Newmarch lectureship at University College, London, commemorates him.

**Newmarket.** Urban dist. and market town, partly in Cambridgeshire and partly in Suffolk, Eng-

land, whose residence in the High Street is still shown. Market day, Tues. Pop. 9,753. *See* Horse-racing; *consult* Royal Newmarket, R. C. Lyle, 1946.

**New Mexico.** S.W. state of the U.S.A. It has an area of 121,666 sq. m. and ranks fourth in size among the states. The surface is crossed by detached ranges of the Rockies, but in the S.E. is a barren plain, the whole comprising part of a great plateau with a minimum elevation of 2,876 ft. Sierras and canyons are notable features and there are several peaks 12,000-14,000 ft. high. The Carlsbad caverns, in a national park of 70 sq. m. in the Guadalupe Mts., are among the deepest and most extensive in the world. The Rio Grande flows N. to S., cutting the state into two unequal portions, and farther E. is an affluent, the Rio Pecos.

Irrigation is increasingly practised, large dams including Elephant Butte. Principal industries are stock raising and farming;

the Mexican War. It became a territory in 1850, and entered the Union as the 47th state in 1912. Two senators and two representatives-at-large are sent to congress. Pop. 531,818.

**New Mills.** Urban dist. and town of Derbyshire, England. It stands on the Goyt and Jett, 8 m. S.E. of Stockport, being served by rlys. The industries include textile printing, bleaching, and dyeing, and the manufacture of paper and sweets. Pop. 8,300.

**Newmilns.** Police burgh of Ayrshire, Scotland. It stands on the Irvine, 7 m. E. of Kilmarnock, and is served by rly. Newmilns was made a burgh in 1490, and had a castle about that time, but its prosperity dates from the introduction of lace and other textile manufactures in the 19th cent. Pop. 3,979.

**New Model Army.** Name given to the army raised in 1645 by the parliament to fight against Charles I. After the passing of the self-denying ordinance, and the consequent resignations of some leading generals, parliament raised from the existing army and by impressment a special force of 14,000 infantry and 7,000 cavalry. It was placed under Sir Thomas Fairfax, was known as the new model army, and quickly became a drilled and disciplined force. On June 13, 1645, Cromwell joined it as leader of the cavalry, and on the next day it fought and won at Naseby. The Coldstream Guards trace their descent from the new model.

**Newnes.** Town of New South Wales, Australia. It is in Cook co., on the central tableland, 35 m. N.N.E. of Lithgow. Noted for its mines of oil shale, it is the terminus of a branch line from Newnes Junction on the main western rly. from Sydney to Bourke.

**Newnes, SIR GEORGE** (1851-1910). Founder of a famous English publishing firm. Son of a Congregational minister, he was born at Matlock Bath, March 13, 1851, and after education at Silcoates and the City of London school entered the fancy goods trade. He started the weekly *Tit-Bits* (q.v.) in Manchester in 1881, and brought it to London in 1884. Later he issued *The Strand Magazine*, *The Wide World Magazine*, *The Ladies' Field*, *Woman's Life*, etc.; and in 1893 the *Westminster*

Newmarket. Finish of one of the classic races on the world-famous Newmarket Heath, headquarters of horse-racing in England

land. It is 13 m. E.N.E. of Cambridge, and has a rly. station. The headquarters of horse-racing in England, Newmarket Heath has two principal racecourses, the Rowley course and the July course; it is traversed by the Devil's Dyke. Around are numerous training establishments, and the main industry is providing for horses and the visitors frequenting race meetings. Events include the Cambridgeshire, Cesarewitch, and Two Thousand and One Thousand Guineas. The Jockey Club has its headquarters here. The buildings connected with racing include the subscription rooms, Rous memorial institute, and Astley institute. S. Mary's, an old Gothic building restored, and All Saints are the chief churches. James I made Newmarket a racing centre and built a house here, as did

cotton is the chief crop. In the desert of Los Alamos, N.W. of Santa Fé, is a centre of atomic energy research; Alamogordo air base, 125 m. S.E. of Albuquerque, was the site of the first atomic bomb explosion, July 16, 1945. New Mexico is rich in copper, while undeveloped resources include 192,000 million tons of coal and 33,000,000 tons of gypsum. Hobbs increased its pop. from 593 in 1930 to 10,619 in 1940 with the discovery of oil. Historic and scenic features include eight national monuments, among them Aztec ruins and Gila cliff dwellings. Santa Fé (q.v.) is the capital. The state university is at Albuquerque and the normal university at Las Vegas.

The area, explored by Spaniards early in the 16th century, became part of Mexico in 1821, and was ceded to the U.S.A. at the end of

Sir George Newnes, British publisher Langlier

Gazette (*q.v.*). His firm became a limited company in 1891, and in 1920 joined forces with that of C. Arthur Pearson, Ltd. Liberal M.P. for Newmarket, 1885-95, and for Swansea, 1900-10, Newnes was made a baronet in 1895. He died June 9, 1910, and was succeeded by his son, Sir Frank Hillyard Newnes, who was born Sept. 28, 1876, and went to Clare College, Cambridge. Chairman of the family firm and director of many associate houses, he was called to the bar 1898, and was Liberal M.P. for Bassetlaw, 1906-10.

**Newnham College.** College for women in Cambridge university. Founded for resident

Newnham College, Cambridge. Clough Hall and, left, Sidgwick Hall, from the south

women students in 1871 by the Newnham Hall Company, the first hall was built in 1875. Five years later the company was amalgamated with the Association for Promoting the Higher Education of Women in Cambridge, and the society was incorporated. The college includes Old Hall (the original Newnham Hall), Sidgwick Hall, Clough Hall, so named after the first principal, Anne J. Clough (*q.v.*), and Peile Hall. It is undenominational. There is accommodation for over 200 students.

**New Norcia.** Roman Catholic abbey in Western Australia. Situated 80 m. N.E. of Perth, it was founded in 1846 by two Spanish Benedictines who came to undertake a mission to the aborigines. Originally called Nursia, after the birthplace of S. Benedict, the abbey was established in desolate scrub country and completed in 1850. It became the centre of outstanding work in converting and civilizing the aborigines, and now has within its spiritual jurisdiction an area of 16 sq. m. with an R.C. pop. of 3,000.

**New Order.** Name coined by the German National Socialists in 1940 for the regime they had decided to impose on occupied countries of Europe. The Germans were naturally to be the master race; nearest to them came the other Nordic races, Dutch and Scandinavian; next in order, Belgians, French, Czechs, and

Poles. Each country's economy was to be organized to Germany's advantage, but a degree of self-government was promised to those nations that merited it. In 1941 the Japanese produced a scheme for a new order in Asia on comparable lines.

**New Orleans.** City and port of Louisiana, U.S.A. The capital of Orleans parish and the largest city and the commercial capital of the state, it stands mainly on the left bank of the Mississippi, 107 m. from its mouth, and is served by Southern Pacific and other rlys. Much of the land bordering the city proper is marshy and below the level of the river at high tide,

necessitating the building of levees, which extend along the city front and for many miles. The city covers about 200 sq. m., but the inhabited portion is only about 40 sq. m. It has 27 m. of frontage, on both banks of the river, which at a point opposite Canal Street is half a mile wide and from 40 ft. to 200 ft. in depth. Over this waterway more than 16,000,000 short tons of products, valued at one billion dollars moved in and out from the sea in 1939.

The streets in the central part are mostly narrow, but in the suburbs are broad and lined with trees. Canal Street, which separates the picturesque old French section from the newer commercial part, is the principal business

thoroughfare. Open spaces are Audubon Park of 250 acres, City Park of 216 acres, and Jackson, Beuregard, and Lafayette Squares. N. of the city the river nears Lake Pontchartrain, with which it is connected by a 6-mile canal.

With few exceptions the public buildings lack architectural splendour. The most noteworthy are the cathedral of S. Louis, a Creole-Spanish structure erected 1794, the archbishop's palace, dating from 1737, the granite custom house near the E. end of Canal Street, and the cotton exchange.

Institutions for higher education include Tulane university, known formerly as the university of Louisiana, with faculties of law, arts and sciences, medicine, and technology; Loyola (R.C.) university, which broadcasts daily; Dillard university for coloured students; the Ursuline academy, founded 1730; and the Jesuit college, opened 1847. The French Opera House, the principal place of entertainment, dates from 1859. A carnival is held on Shrove Tuesday (Mardi-Gras).

The cemeteries are a remarkable feature of New Orleans. The soil is so saturated with water that burial beneath the surface is not possible, and vaults with arched cavities are used, the coffins being ranged one above the other in tiers, 12 ft. above the ground level.

New Orleans is one of the most important commercial cities of America, and, after Liverpool, the foremost cotton port of the world. It has also flourishing manufactur-

New Orleans, Louisiana. Plan of the central districts of the city, showing the principal quays on the Mississippi

New Orleans, Louisiana. 1. Looking down Charles Street from Lee Circle towards Canal Street. The stone column is surmounted by a statue of Robert E. Lee. 2. Dumaine Street, in the old French quarter. 3. Jackson Square, with the cathedral of St. Louis, built 1792-94. 4. Air view of the city and the Mississippi river

ing interests. Sugar refining is a leading industry, and machinery, cotton goods, cotton-seed oil, boots and shoes, cigars, and furniture are produced. Economic life is largely carried on by Americans of Jewish descent; political life by Catholics of Irish and French.

Settled in 1717 by the French, who named it after the duke of Orleans, then regent of France, New Orleans was later deserted, but resettled in 1722. It became the seat of government of the French territory of Louisiana, and continued to flourish after its cession to Spain in 1763. In 1800 it fell to France, from whom it was purchased by the U.S.A., together with the remainder of Louisiana, in 1803, and ten years later was incorporated, having become a port of entry. It was the capital of Louisiana down to 1849, when it was superseded by Baton Rouge, and again during 1864-80. In 1815 the British made an unsuccessful attack on the city. Pop. 494,537.

**New Party.** Political party founded by Sir Oswald Mosley (*q.v.*) in Feb., 1931. He had laid down the principles of his political beliefs in a manifesto published in Dec., 1930; and when he found his views diverging fundamentally from those of the Labour party, he and five other Labour M.P.s broke away and formed the New Party as an Independent group. Of 23 candidates at the 1931 general election, not one secured election although they supported the National government. The party then collapsed.

**New Plymouth.** Town of New Zealand. Situated on the S.W. coast of N. Island, N. of Mt. Egmont, it is the chief town of the Taranaki dist. It is a centre for the cattle-rearing and dairying industry of the dist., and is connected by rly. via Marton Junction with both Wellington and Auckland. The first settlement was made by the pioneers of the New Plymouth Co. in 1841. Pop. 20,642.

**Newport.** Mun. borough and market town, also the capital, of the Isle of Wight. It stands on the Medina, near the centre of the island, 8 m. S. of Ryde, and is served by the island rlys., of which it is the headquarters. The chief building is the church of St. Thomas. Rebuilt in the 19th century, it contains some memorials from the older building, and a monument to Princess Elizabeth, daughter of Charles I. There are a guildhall, corn exchange, museum, a grammar school dating from 1612, and a blue-coat school for girls, founded in 1761.

In the grammar school, Charles I made the treaty of Newport. God's Providence House is an interesting old building.

The industries include brewing, and the town is a centre for the general trade of the island. Newport was at one time a port, and in the 12th and succeeding centuries its citizens obtained various privileges, while it took the place of

Carisbrooke as the island capital. In 1607 it became a chartered town, and from 1584 to 1885 was separately represented in Parliament. Market days, Tues. and Sat. Pop. est. 20,000.

**Newport.** County and mun. borough, seaport, and market town of Monmouthshire, also the largest

Newport, Monmouthshire, arms

town. It stands on the Usk, 4 m. from its mouth, and is 12 m. from Cardiff and 133 by rly. from London. The town is chiefly on the W. side of the river; on the E. is the suburb of Maindee, included in the borough in 1889. The chief buildings are the church of S. Woollos, some parts of which are Norman and others Perpendicular, the town hall, the offices of the county council, art gallery, and museum and market hall. Others include the technical college, the civic centre in Clytha Park, and the Royal Gwent Hospital. There are remains, including two towers, of a castle, remodelled in 1424, after having been burned by Owen Glendower. S. Woollos church is the pro-cathedral for the diocese of Monmouth.

Newport does a large shipping trade, mainly in coal and iron, for which it has modern docks, covering 160 acres. Other industries are shipbuilding, brass and iron founding, and the manufacture of galvanised iron sheets, steel tubes, nails, engines, boilers, chemicals, railway plant, glass, pottery, etc. A transporter bridge, consisting of 2 steel lattice towers 240 ft. high, with a platform running between, crosses the Usk.

Newport owes its origin to its position on the borders of Wales, a castle having been built here about 1200. The townsmen obtained a guild merchant and other privileges, and in 1624 it was made a corporate town. Its modern growth began with the opening of the S. Wales coalfield, and large extensions of docks were made in the 20th century to cope with the increasing trade. On Nov. 4, 1839, there was a serious rising of the Chartists here.

The name of new burgh was given to the place about 1100 to distinguish it from the older Caerleon, and it became Newport. Since 1839 it has been governed by a mayor and a corporation on modern lines. From 1832 to 1978 it united with Monmouth to send a member to parliament, while from 1918 it has been represented

separately. Market days, Wed. and Sat. Pop. est. 100,000.

**Newport.** Police burgh of Fife, Scotland. It stands on the Firth of Tay, 1½ m. S.E. of Dundee, of which it is practically a residential suburb. It is served by rly. while a ferry connects it with Dundee across the Tay. Pop. 3,320.

**Newport.** Seaside resort of Pembrokeshire, Wales. It stands on Newport Bay, at the mouth of the Nevern, 10 m. from Cardigan and 6 m. from Fishguard. About 1300 a castle was built here, and it was at one time a flourishing port and a centre of the woollen manufacture, but after 1700 it began to decay, and lost its market rights and its position as a chartered town. There is a small harbour, but it is not easy of access.

**Newport.** Market town and urban district of Shropshire. It stands on the Shrewsbury canal, 17 m. from Shrewsbury and 145 m. by rly. from London. The chief building is the rebuilt church of S. Nicholas, and there are a town hall, corn exchange, and grammar school of 1665, also an old market cross. The industries include a trade in agricultural produce and the manufacture of farming implements and valves.

Newport was founded about 1100, and the townsmen received a number of privileges, including a guild merchant. In 1551 it was made a chartered town under a high steward, and this constitution existed until 1833. In 1894 it was made an urban district. Market day, Fri. Pop. 3,738.

**Newport.** City of Kentucky, U.S.A., in Campbell co. It stands at the confluence of the Licking and Ohio rivers, opposite Cincinnati, and is served by the Nashville and the Chesapeake and Ohio rlys. The great steelworks here was the scene of a strike which began in 1921 and lasted for seven years. Settled in 1790, Newport was incorporated in 1795 and became a city in 1850. Pop. 29,744.

**Newport.** City and port of entry of Rhode Island, U.S.A., the co. seat of Newport co. Formerly the capital of the state, and now a summer resort on Narragansett Bay, 29 m. S. of Providence, it is served by the New York, New Haven, and Hartford rly. It has a secure and spacious harbour, and several naval establishments. During the period 1890–1914 it was the summer capital of wealth and fashion, its seaward drive being lined with the palaces of the millionaires. The American “400”—the social élite—were so called

because the Newport ballroom of Mrs. William Astor, leader of society, held only that number. It reflects, in its architectural styles, Rhode Island's early hospitality to dissenting sects, of which five built their earliest American churches at Newport. Settled in 1638, Newport was chartered as a city in 1784 and rechartered in 1853. Pop. 27,612.

**Newport News.** City and port of entry of Virginia, U.S.A. The Atlantic terminus of the Chesapeake and Ohio rly., at the mouth of the James river and the head of Hampton Roads, it was a small fishing village until the line was completed in 1882. A shipbuilding and dry dock company, founded here in 1896, the year of the city's incorporation, has one of the largest yards in the world, ideally situated with respect to tides, deep water, and proximity to the sea. During the First Great War about 14,000 men were employed and this number has been doubled. In 1936–37 the Farm Security Administration provided model low-cost housing on 436 acres near Newport News, a project carried out by negroes. In the city's foundries, turbines were cast for hydro-electric power plants under the T.V.A., as well as for Dnepropetrovsk, U.S.S.R. Pop. 37,067.

**Newport Pagnell.** Market town and urban dist. of Bucks, England. It stands where the Ouse joins the Ouse, 14 m. N.E. of Buckingham and 50 m. N.W. of London. The town is served by rly. and the Grand Union Canal. Electricity is supplied from Northampton. The chief building is the church of SS. Peter and Paul, dating in the main from the 14th century, with two fine porches. Among several charities is an almshouse, founded in 1280, now known as Queen Anne's hospital, after the queen of James I. The centre of an agricultural district, the town was once known for its manufacture of lace. A castle was built in the Middle Ages, but disappeared soon after it had been taken by the parliamentarians during the Civil War. Market day, Wed. Pop. 4,530.

**New Providence.** Island of the Bahamas. It lies between Andros (W.) and Eleuthera (E.), and is 19 m. long by 10 m. wide. It is covered with undergrowth and contains extensive lagoons. On its N. coast is Nassau, the seat of government of the Bahamas. This is the most densely populated of the islands, and produces fruits,

being specially noted for the pine-apples exported to England and the U.S.A. in large quantities. Settled by the English in 1629, it was permanently colonised early in the 18th cent. Pop. 29,391.

**Newquay.** Holiday resort and urban dist. of Cornwall, England. It is on the N. coast on Newquay

and chartered as a city in 1899. Population 58,408.

**New Ross.** Urban dist., market town, and river port of Wexford, Eire. It stands on the Barrow, 13 m. N.E. of Waterford, with a rly. station. On the other side of the river, in Kilkenny, is Rosbercon, part of the urban dist.

**Newquay.** Bathing beach at this popular holiday resort of North Cornwall

Bay, 14 m. N. of Truro, and is reached by rly. With a small harbour, it has a shipping trade and is a fishing port, but visitors are mostly attracted by the rugged coast scenery and bathing and surfing. Pop. 10,450.

**New River.** Artificial waterway in Herts and Middlesex, England. Fed by the Chadwell and Amwell springs in Herts, and by the Lea at Broxbourne, it extends S. about 24 m. to Stoke Newington, having reservoirs in the bors. of Stoke Newington and Hornsey. Constructed by Sir Hugh Myddelton (*q.v.*), 1609-13, at a cost of £500,000, the undertaking was acquired by the Metropolitan Water Board (*q.v.*) in 1904, when the New River Co. received as the purchase price £6,534,000 of 3 p.c. water stock, besides certain contingent rights estimated roughly at an additional £500,000. New offices of the Water Board were opened at Rosebery Avenue, on the site of the New River Head, in 1920, at a cost of £300,000.

**New Rochelle.** City of New York, U.S.A., in Westchester co. It stands on Long Island Sound, 17 m. N. by E. of New York city, and is served by rlys. Among many fine residences are mansions dating from the Dutch and English colonial periods. Leland Castle, noted for its interior decorations, is occupied by an Ursuline seminary. Here Tom Paine was buried in 1809 on land presented by the state, but his remains were taken back to England by Cobbett in 1819. The town was settled by Huguenots in 1688, incorporated in 1847,

The industries include shipping, for which there are quays along the river, tanning, and fishing. New Ross was probably built by the English settlers, and was a corporate town surrounded by walls. It was besieged by Cromwell, who destroyed the fortifications. There was fighting here during the rising of 1798. From 1574 to 1800 it was separately represented in the Irish parliament, and during 1800-85 in the British. Rosbercon, which was once a separate borough, had a monastery founded about 1200. Old Ross is a village  $3\frac{1}{2}$  m. away with ruins of a castle. Market days, Wed. and Sat. Pop. 5,800.

**Newry.** Urban dist., market town, and seaport of co. Down, N. Ireland. It stands on the river Newry, which has been canalised to afford access for vessels from the sea, 35 m. from Belfast and 63 from Dublin, with which it has rly. connexion. The town has a technical school. Eight bridges

cross the river here, and there are four drawbridges over the canal. An important port for the export of agricultural produce and cattle, its other industries include corn and meal mills, a large flax-spinning mill, and a spade and shovel factory. The older part of the town is separated by the river from the

newer part called Ballybot. Newry grew up round an abbey founded in 1175. It was made a chartered town soon after 1600, and until 1800 sent two members to the Irish parliament. From 1800 to 1918 it returned one member to the British house of commons; since 1918 its representation has been merged in the county. Market days, Tues., Thurs., Sat. Pop. 12,738.

**News Agency.** Organization for the regular supply of news to newspapers. Most agencies supply news of all kinds, but there are specialist agencies dealing with specific subjects, *e.g.* sporting, naval, military, aeronautical, motoring, shipping, law, finance, etc. The earliest existing news agency is Reuters (*q.v.*), which is controlled by the Press Association and the Newspaper Proprietors' Association. Reuters deals with overseas news and the Press Association with home news. Other important news agencies in Britain are the Exchange Telegraph Company and Central News. The principal news agencies in the U.S.A. are the Associated Press of America, and the United Press of America; the latter operates in Great Britain as the British United Press. Other agencies which have given worldwide coverage of events include Havas, France; Domei, Japan; and Tass, the U.S.S.R.

**News Chronicle.** London daily newspaper. Founded in 1846 as the Daily News under the editorship of Charles Dickens, it purchased the Morning Leader and the Star in 1912, the latter, an evening publication founded by T. P. O'Connor in 1888, being continued separately. In 1928 the Westminster Gazette, founded by Sir George Newnes in 1893, was absorbed, and in 1930 the Daily Chronicle, founded in 1855 as the Clerkenwell News, was amalgamated with the Daily News, which then adopted

**New Scotland Yard, London.** Headquarters of the Metropolitan Police, seen from the Victoria Embankment

its present title *News Chronicle*. The newspaper is now largely owned by the Cadbury family and is regarded as the organ of Liberal opinion. It is published at Bouverie Street, London, E.C.4.

**New Scotland Yard.** Name given to the headquarters, on the Thames Embankment, of the London Metropolitan Police. The headquarters of the police were removed from Whitehall to New Scotland Yard in 1890. The building was designed by Richard Norman Shaw (1831-1912) and is considered to be his finest work. Its telephone no., Whitehall 1212, became famous. See *Metropolitan Police*; *Police*; *Scotland Yard*.

**News from Nowhere.** Story by William Morris, first published in America, 1890, and in England, 1891, with the sub-title, *An Epoch of Rest, Being some Chapters from a Utopian Romance*. It was written as a reply to *Looking Backward* (*q.v.*), and presents socialism of a different kind, showing it in practice some two or three centuries forward from the time at which the book was written.

**New Siberia.** Name of three groups of islands (Liakhov, Anjou,

De Long) in the Arctic Ocean, in the Yakutsk A.S.S.R. The largest is Kotelnoi (Kettle Island). They are uninhabited, containing vast beds of petrified wood and fossilised mammoth bones. Area, 9,650 sq. m.

**Newsletter.** Term once applied to private letters containing news, of which the London letters in provincial and foreign newspapers are a kind of survival. Before printing was invented, letters between friends and relatives contained accounts of current events; sometimes they were written by tutors or other retainers. Then came professional writers of news, who existed concurrently with the newspapers of the 17th century, in the latter part of which they supplanted the newspapers as a result of the stringency of the licensing system applied to anything printed. These newsletters, as J. B. Williams points out in his *History of English Journalism* (1908), are more valuable sources of history than printed periodicals. Such were the Paston letters (*q.v.*) of the 15th century, and the Fugger News Letters (see Fugger) of the 16th.

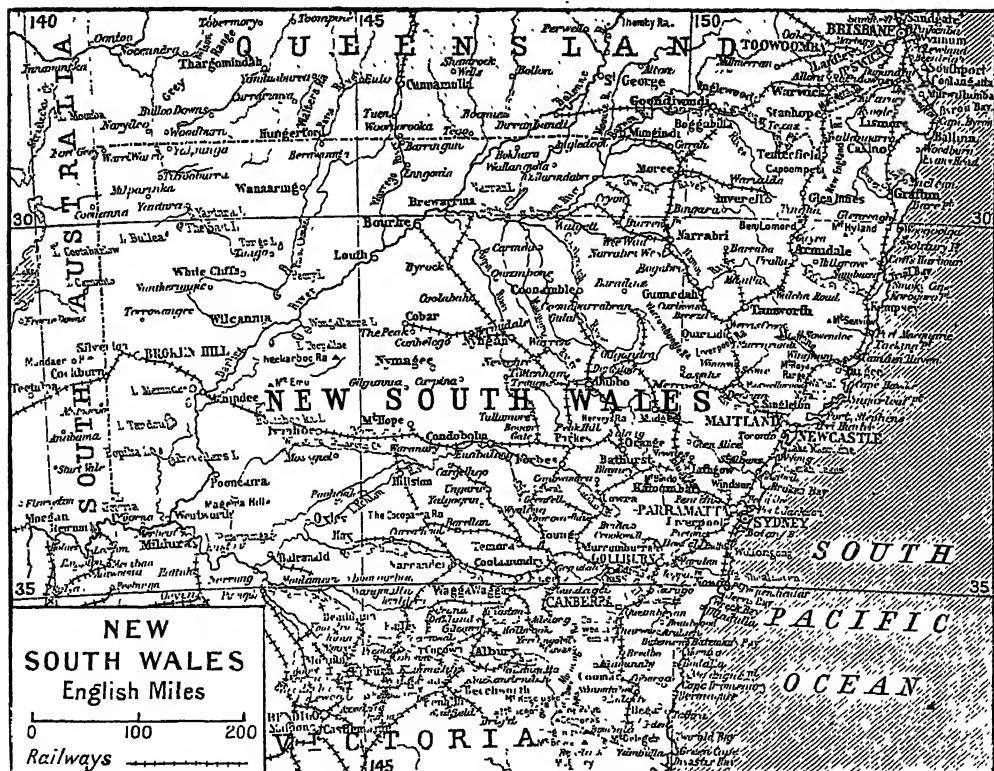

Periodical publications of the 20th century described as news-

letters were often an attempt to disseminate at regular intervals personal or specialised interpretations of current events, *e.g.* The *King-Hall News Letter* (later The *News Letter*), The *Week*, and K. de Courcy's monthly memoranda on foreign affairs and strategy, all introduced during the later 1930s. They were posted to subscribers and carried no advertising. See *Journalism*; *Newspaper*.

**News of the World.** London Sunday newspaper, founded Sept. 29, 1843, by John Browne Bell. In 1890 it was acquired by Lascelles Carr and George Riddell, afterwards Lord Riddell. Its circulation of over 8,000,000 (1950) is the world's largest for newspapers.

**New South Wales.** Oldest state of the Australian Commonwealth. It lies on the E. coast, between Queensland and Victoria. In 1788, when British authority was first exercised, the name was applied to the whole of the continent E. of meridian 135° E.

Physically the dominant feature is the main watershed, or divide, which follows roughly the trend of the coast 80 m. W. of it in the N. and 40 m. W. in the S.; this

New South Wales. Map of the oldest state of the Australian Commonwealth

divide, known by various names, Snowy Range, Blue Mts., New England Range, etc., separates the

New South Wales  
arms

short rivers which flow to the E. coast from those which belong to the system of the Murray-Darling. The divide crosses the great plateau, a plain once eroded

almost to base level and since uplifted and dissected, so that the peaks are residual mountains.

The process of erosion is, moreover, continuous, and the coastal rivers are still cutting down into the plateau and forcing the watershed W., so that it is now W. of the highest peaks. E. of the divide the coastal area is a plateau carved by the rivers into valleys, gorges, and scarps which present, from the coast, a complicated highland mass. W. of the divide the plateau descends more gently to the great plains across which the rivers, sometimes in heavy flood, sometimes a mere trickle, or a string of disconnected pools, ultimately reach the Murray. These plains are almost level.

The main rivers of the E. are the Shoalhaven, Hunter, Manning, and Clarence, in all of which either the main stream or tributaries flow roughly parallel to the coast to a lower course which flows directly coastwards, the whole making a T-shaped or L-shaped plan. On the W. the Murrumbidgee, Lachlan, and Darling make wide sweeps across the plains. The lakes are mountain tarns, as Blue Lake near Kosciusko, isolated basins like Lake George N.E. of Canberra, valley lakes, similar to Lake Bathurst, where a side valley has been dammed with alluvium, river-fed hollows like Lake Menindee, which acts as a regulator for the Darling, or coastal lagoons.

The climate is controlled by the steady procession from W. to E. of a succession of high pressure areas. Between them frequently blows the southerly "buster," a cyclonic wind, which causes a fall of temperature and is usually accompanied by rain and often attains a speed of 50 m.p.h. Rains are distributed uniformly throughout the year, but in the N.E. the summer, and in the S.W. the winter, is the rainy season. Kangaroos, wombats, phalangers, lyre birds, emus, and lorikeets are characteristic animals.

The plains are grass lands, interspersed with mallee or mulga and brigalow scrub; the plateau, especially on the E., is forested with wattles (acacias), eucalyptus, or gum trees, which grow after being cut and are ready for cutting again after a few years, making an almost inexhaustible store of timber.

The aridity of the plains, coupled with the ever present possibility of a season of drought, has led to the adoption of every possible means of saving water.

The minerals occur in definite areas, in the N.E. tin, at Inverell; in the far W. silver lead, at Broken Hill, and opals, at White Cliffs; in the centre of the plateau, coal, at Newcastle and Bulli; in the centre copper, at Cobar; and in the centre and S.E. gold, at Araluen, Cobar, and Bathurst. The wet E. is devoted to lumbering and dairy farming; profitable wheat farming is limited by the rainfall to the area where the fall lies between 20 and 30 ins.; the arid W. is devoted to sheep. Sugarcane and tropical fruits near the N.E. coast, vines in the Hunter Valley and near the middle course of the Murray river, at Albury,

are specialised products. Pop. 2,912,791, of whom about one-half live in Sydney, the state capital. The federal territory of Canberra (*q.v.*) lies within New South Wales. Area, 309,432 sq. m.

Government is dual. New South Wales is controlled, in part, by the Commonwealth parliament, and in part by the local parliament of two houses—the legislative council and the legislative assembly of 90 members. Executive authority is vested in a governor, assisted by a lieutenant-governor, and a cabinet of responsible ministers. Botany Bay was discovered in 1770 by Capt. Cook, the state then becoming a British possession; the first convict fleet arrived in 1788, when the first settlement was established at Port Jackson; transportation ceased in 1850. A partially elective legislative council was established in 1842, and responsible government in 1856. *See Australia.*

**New South Wales, BANK OF.** Institution founded in 1817. It has 778 branches and operates throughout Australia, New Zealand, and the Pacific islands. Its head office is at Sydney, and its London office at 29, Threadneedle Street, E.C.2.

## THE NEWSPAPER AND ITS INFLUENCE

Viscount Camrose, Editor-in-Chief, *The Daily Telegraph*

*Details of the world's leading newspapers are given under their appropriate headings throughout this Encyclopedia. See also under Journalism; and the biographies of many notable journalists and newspaper men of the present and past, e.g. Camrose; Kemsley; Northcliffe; Rothermere; Scott, C. P.; Stead, W. T.; and (in the U.S.A.) Greeley, H.; Hearst, W. R.; McCormick, R. R., etc.*

In Dr. Johnson's Dictionary newspapers are defined as "papers which give an account of the transactions of the present times." Transactions may be taken to include public affairs at home and abroad; contemporary literature, music, painting, and drama; commerce, including advertisements, and any other activities, intellectual, cultural, political, financial or commercial, which affect the lives of, and therefore interest, men and women belonging to a particular society. Though there have been enormous changes in the form and availability of newspapers, their essential purpose has remained constant. In one of the earliest newspapers, whose first issue appeared on May 29, 1695, the proprietor and editor, John Whitlock, announced that his newspaper would aim at presenting "an impartial survey of events of public use and advantage, not only to the curious and speculative, but also to the trading part of mankind." His object, he said, was to pre-

sent news only, "supposing other people to have sense enough to make reflections for themselves." Most editors today would be ready to endorse Whitlock's conception of the function of a newspaper.

**EARLY JOURNALISTS.** Johnson himself was one of the first great English journalists. Apart from his well-known contributions to *The Idler* and *The Rambler*, for some time he wrote reports on parliamentary debates for the bookseller Cave. He was unable, like parliamentary reporters today, to sit in the press gallery. Cave arranged for him to receive reports on "the subject of discussion, the names of speakers, the side they took and the order in which they rose, together with notes of the arguments advanced and the course of the debate." From this material Johnson "composed the speeches," which usually flattered those who had delivered them by being more eloquent and sagacious than the originals. Johnson, however, "disapproved

the deceit he was expected to practise, and was not easy till he had disclosed the deception."

Other distinguished pioneers were Addison, who founded *The Spectator*; Steele, who founded *The Tatler*; and Swift, who for some years contributed regularly to *The Examiner*. Swift's contributions, as was to be expected, were highly opinionated, and originated what came to be called the leading article or editorial.

Perhaps the most notable of all early journalists was Daniel Defoe, who founded *The Review* at the beginning of the 18th century. This talented and versatile man, if he was less of a moralist than Johnson and Addison, less of an essayist than Steele, and vastly less settled in his opinions than Swift, was a first-rate reporter, and, as it would now be called, columnist. He was even able to provide an eye-witness account of the great plague of 1664-65 (*Journal of the Plague Year*) which was accepted as authentic until it was noticed that Defoe was only a young child at the time the catastrophe occurred.

Wilkes in his North Britain fought for the right to publish parliamentary proceedings, and undeniably played a large part in freeing newspapers from governmental restrictions. The influence of William Cobbett's robust, highly individual journalism reached far beyond the normal newspaper readers of his time. Junius, now believed to have been Philip Francis, in his Letters exerted a great influence on public affairs. Leigh Hunt's vigorous conduct of *The Examiner* earned him some months of imprisonment, which, however, he spent in considerable ease with full facilities for writing.

These were the first great names in a profession which has continued to attract men of outstanding ability—Delane of *The Times*, Le Sage and Edwin Arnold of the *Daily Telegraph*, C. P. Scott of the *Manchester Guardian*, and J. L. Garvin of the *Observer*, to mention only a very few.

**FREEDOM OF NEWSPAPERS.** Though the newspaper, as known today, is a comparatively recent development, its equivalent has existed since the beginning of time. There are no human beings so primitive that they are not curious about their own and their neighbours' affairs, and who do not find some means of satisfying that curiosity. Before the printing press there were written newsletters; before the telegraph there

were postboys and couriers; before writing as a means of communication existed there was word of mouth. Through the most remote jungle and across the widest deserts there somehow passes, and always has passed, news of what is happening far and near.

The appetite for news is so widespread and so rapacious that it has inevitably engaged the attention of governments. In England the freedom of newspapers from government interference has been achieved only with difficulty, and, incidentally, can be maintained only with vigilance. In 1632 the Star Chamber issued an edict forbidding the printing of foreign news. When nine years later the Star Chamber was abolished, the free press revived, but was again suppressed in 1649 by Cromwell, who, like the totalitarian rulers of today, allowed the publication of official journals only. One of them, ironically enough, in view of the position he took in *Areopagitica*, was edited by Milton. An official journal, the *London Gazette*, which first appeared on February 5, 1666, has been published twice a week ever since.

#### The Stamp Tax

With the Restoration the situation was easier, and after the Revolution of 1688 all press censorship came to an end, with the result that newspapers and periodicals greatly increased in popularity. Their growing influence alarmed the government, and an attempt was made to curtail their circulation by means of a stamp tax. Though the stamp tax was subsequently increased from 1d. to 4d., and an additional tax on advertisements was imposed, newspapers still multiplied (there were 53 in London alone in 1776) and increased their circulations. The tax was finally abolished in 1855. In June of that year the *Daily Telegraph* began publication at 2d., and then after ten weeks was reduced to 1d. Hitherto the position of *The Times*, whose price had been reduced successively between the years 1836 and 1861 from 5d. to 3d., had been unchallenged.

Apart from extraordinary measures taken in wartime, there was no attempt seriously to interfere with the conduct of newspapers until 1947, when, as a result of pressure from its own supporters in parliament, a Socialist government set up a royal commission "to inquire into the control,

management, and ownership of the newspaper and periodical press and news agencies." A parliamentary debate which preceded the setting up of this royal commission indicated that a desire existed, not merely to inquire into the ownership of newspapers (which in any case was known already) but to find means of curtailing their freedom to criticise government policy. Like the Star Chamber, which first instituted control of the press, the commission adopted the unusual procedure of hearing all evidence in camera. The practice was, however, changed after a short time and the evidence was published. This was fortunate in view of some of the unsubstantiated and reckless statements made in evidence by a few of the witnesses in their desire to produce a strong case against the press.

**THE MODERN NEWSPAPER.** The founding of the *Daily Telegraph* demonstrated the practicability of a national newspaper at 1d. By the eighties it could claim "the largest circulation in the world." In 1896 Alfred Harmsworth, afterwards Lord Northcliffe, founded the *Daily Mail* at 4d., and its circulation soon shot up to near the million mark. Its treatment and presentation of news, as well as its editorial comment, were less ponderous than had hitherto been the case. If this led to the charge that the serious purpose of a newspaper was being sacrificed to entertainment (curiously enough, the same charge was made in the early 17th century when newsletters gave place to newspapers), the *Daily Mail* continued to prosper and to provide a model which other popular newspapers attempted to follow. The *Daily Express*, founded in 1900 by Arthur Pearson and personally controlled by Lord Beaverbrook after the First Great War, and the *Daily Mirror*, founded by Lord Northcliffe in 1903, succeeded. The *News Chronicle*, which began as the *Daily News*, under the editorship for a brief while of Charles Dickens in 1845, and the *Daily Herald*, which was founded in 1912 and was taken over officially by the Labour party in 1923, became in time large circulation newspapers. The provincial press underwent fewer changes than the national, but continued to exert proportionately greater influence.

More even than the national dailies, the Sunday newspapers built up vast circulations. The

News of the World, for instance, founded in 1843, attained a circulation of over one million in 1906, and forty years later had run its circulation up to the staggering total of 7½ millions. The People, the Sunday Pictorial, the Sunday Express, the Sunday Empire News, and the Sunday Dispatch also came to have circulations running into millions.

This vast extension of newspaper circulations which took place in the first three decades of the 20th century was made possible by inventions like the rotary press and the linotype machine, which enabled large numbers of newspapers to be printed quickly; and by a new process for making paper which greatly reduced its cost. At the same time, the operation of the Education Act of 1870 led to a great increase of literacy, and therefore in the potential newspaper-reading public. A demand for popular newspapers existed, and the means of satisfying this demand were made available. In the days of the Napoleonic wars a circulation of 4,000, such as that of the Morning Post, was considered to be large, but newspapers in later years have come to reckon their circulations in hundreds of thousands and then in millions.

#### The News Agencies

Another important factor in the development of the popular press has been the news agency. Though national newspapers pride themselves on having their own exclusive home and foreign news services, they must also to a greater or smaller extent rely upon agencies like Reuters, founded by Julius Reuter in 1849, for foreign news, and the Press Association for home news. In 1947 the control of Reuters by the Newspaper Proprietors' Association and the Press Association was extended to include representatives of the Australian and New Zealand press.

**AFTER THE SECOND GREAT WAR.** The governing factor in the post-war circumstances of British newspapers was shortage of newsprint. During the war itself rationing of available supplies was organised by the Newspaper Supply Company, consisting of representatives of national and provincial newspapers, acting under the Paper Control. This arrangement prevented the normal play of competition between newspapers, and artificially stabilised their relative positions. Of

the 13 London morning newspapers, two—The Times and the Daily Telegraph—sacrificed circulation to maintain, in the case of the Daily Telegraph, six, and of The Times, ten pages. At the same time The Times increased its price from 2d. to 3d., and the Daily Telegraph from 1d. to 1½d. The other national newspapers maintained their price at 1d., but reduced their size to four pages.

#### Post-War Paper Shortage

After the war the shortage of newsprint continued. Indeed, in consequence particularly of dollar difficulties in Canada, it tended to get worse. In 1947 the government, in order to make an economy of £2,000,000 in its dollar expenditure, further reduced purchases of newsprint, thereby preventing the maintenance of a temporary increase in size instituted in the post-war period. Newspapers were forced to revert to their wartime size. If, in the artificial conditions imposed by war this did not prevent them from adequately fulfilling their proper function, in the conditions of peace they were seriously handicapped. For instance, the proper reporting of parliamentary debates, so necessary in a democracy, was impossible.

Certified statements of circulation indicate that in July, 1947, the Daily Express was leading all national dailies, with the Daily Mirror as a close runner-up, the Daily Herald and the Daily Mail running neck and neck for the third place. In the case of the two "quality" newspapers, the Daily Telegraph had a circulation of approximately a million, and The Times about 270,000.

The shortage of newsprint effectively prevented any new newspaper enterprise. With the amalgamation of the Financial Times and the Financial News national dailies were reduced from 13 to 12. There continued to be nine Sunday and three evening newspapers. The provincial press consisted of 35 morning and 74 evening newspapers, compared with 45 and 88 respectively in 1921.

In France and most of the countries of western Europe newspapers were even more restricted than in England, and in eastern Europe, as Russian influence spread, they sank into a position of mere organs of official propaganda and vituperation. In the United States, on the other hand, supplies of newsprint were sufficient for newspapers to maintain, and sometimes to increase, their

pre-war size, and to permit of the production of massive Sunday supplements.

**INFLUENCE OF NEWSPAPERS.** If public education multiplied the numbers of those who could read newspapers, the extension of the franchise multiplied those who needed to read them. The Reform Act of 1832 coincided with a drive finally to abolish the stamp duties on newspapers, or "tax on knowledge," as they were called. By the time universal adult suffrage was an accomplished fact, a national and provincial press catering for the newly enfranchised was already in existence.

The development of truly representative government, indeed, is invariably accompanied by, and requires, a corresponding development of newspapers free to criticise, approve, and generally comment on, its operation. Wherever, as in the U.K. and the U.S.A., representative institutions authentically function, there are free newspapers. Wherever, as in Nazi Germany, Fascist Italy, and Soviet Russia, there is a dictatorship, newspapers are controlled by the state and used by it to deceive and subjugate their readers. The first step a dictatorship takes is to establish control of newspapers; the first indication that a dictatorship has ended is that newspapers are relieved of government control and interference.

#### Influence and Circulation

Various attempts have been made by means of public opinion polls and other activities to estimate the influence of newspapers. The result of these researches has not been decisive or convincing. It is certain that the influence exerted by newspapers is not strictly proportionate to their circulation. No one would suggest, for instance, that the influence of the Daily Telegraph is one-eighth of that of the News of the World because such is the relation between their circulations. On the other hand, newspapers reaching a wide public do undoubtedly influence their readers. There are those who contend that this influence is less than might be supposed. They point out that although the greater number of U.S. newspapers opposed President F. D. Roosevelt, he was four times triumphantly elected. None the less, it remains the case that dictatorial regimes cannot tolerate free newspapers. They, at least, believe in the influence of newspapers, as is demonstrated by the lengths to

which they go to prevent it operating except on their behalf. Consult British Newspapers and their Controllers, Viscount Camrose, 1947; The Newspaper, S. Rothenberg, 1947; Report of the Royal Comm. on the Press, 1949.

**Newspaper Press Fund.** This assists necessitous members of the editorial staffs of newspapers who have become its members, and their widows and orphans. Founded in 1864 and incorporated in 1890, it is administered by a council of 18 working journalists, assisted by district committees in all parts of the U.K. Up to 1947 the sum of £690,382 had been distributed in grants and pensions. A small porportion of the income from donations is distributed to non-members. The names of recipients are not published. The offices are at Bouverie House, Fleet St., London, E.C.4.

**Newsprint.** Paper upon which newspapers are printed. Since the middle of the 19th century the bulk of newsprint has been manufactured from wood pulp, although some is made from straw and esparto grass. Great Britain annually uses some 850,000 tons in normal times, most of it imported from Canada and Newfoundland. But during the Second Great War imports of both newsprint and pulp were drastically curtailed. At the outbreak of war, most publishers voluntarily restricted the size of papers, because of the drop in advertising revenue, and rationing of newsprint began on March 3, 1940, from which date all imports of paper were prohibited except under licence. Supplies of paper from mills to consumers were limited to 60 p.c. (later 30 p.c.) of the amount used before the war. On Sept. 22, 1946, restrictions were lifted to the extent that newspapers and periodicals might print as many copies as they required to meet demand. From 1947 to 1949 continuing heavy adverse balance of trade with dollar countries caused the British govt. to reimpose a cut in the use of newsprint and a restriction of circulation. See Newspaper; Paper; Ration.

**New Statesman and Nation.** THE. Political weekly journal. It was established under its present title in 1931 by the amalgamation of the New Statesman, founded in 1913, and the Nation, founded in 1907. In 1921 the Nation had absorbed the Athenaeum, founded in 1828, and in 1934 the Week-End Review was taken over. Though socialist in outlook, the New Statesman and Nation was a fre-

quent critic of the official foreign policy of the government elected in 1945. Editorial offices are at 10, Great Turnstile, London, W.C.1.

**Newstead Abbey.** Residence in Nottinghamshire, England, formerly the seat of Lord Byron. It is 8 m. N. of Nottingham. An Augustinian priory was founded here in 1170, and at the dissolution of the monasteries the lands passed to the family of Byron. It was made into a residence, and was the seat of the poet until 1818, when it was sold to Col. Wildman, who improved the house a good deal. Of the original abbey the cloister square, with the refectory and chapter house, and the W. front of the church remain. In 1931 Sir Julian Cahn presented the abbey to the city of Nottingham. The Leen rises within the park. The village of Newstead is a coal mining centre with a railway station. See Byron; Hucknall Torkard.

**Newt or EFT (*Triturus*).** Genus of small, tailed Amphibia, of which Great Britain possesses three species, the common or smooth newt, crested newt, and palmate newt. The common newt is found in most clear ponds, is slightly over three ins. long, has a smooth skin, and is brown with darker marks on the upper parts, and spotted with black on the yellowish underparts. The male has a high frill, extending from the top of the head to the end of the tail. It is much more common than the crested newt, which is nearly twice its size. This species has a warty skin, is dark brown on the back with black spots, has irregular white spots on the sides, and has orange underparts with black spots or patches. It is readily recognized by the fine serrated crest of the male. The palmate newt seldom exceeds three ins. in length. The hind toes in the male are webbed, and it is olive brown on the upper parts, with black spots: the crests are nearly black, and there is an orange band in the middle of the under side.

Newts spend a great part of their time on land, where they lurk

among grass and moss under stones and in holes, usually hibernating in such situations. But at the breeding season in spring they are always found in the water, the eggs being deposited singly on the leaves of water plants, the edges of which are folded over them. The egg hatches out as a tadpole, and the course of its development is similar to that of the frog. At first it has external gills and no legs; but in about three weeks the fore limbs are developed, and by the autumn the metamorphosis is complete. The newt has now four limbs, the external gills have disappeared, and it breathes air by means of lungs.

Newts are carnivorous, feeding upon tadpoles, worms, and insects. The common newt is the only species found in Ireland.

**New Testament.** Name given to the collection of books in the Bible which contain accounts of the life and teaching of Jesus Christ, the beginnings of Christianity, and the faith of the early

Church. These books were written to meet the needs of the Christians of the first century, and it was a considerable time before they were added to the canon of Scripture.

During the lifetime of the apostles and contemporaries of Christ, little importance was attached to the books in comparison with the testimony of the actual witnesses of the events. Even as late as 135, Papias of Hierapolis says, "I did not think that I could get so much profit from the contents of

books as from the utterance of a living and abiding voice." It was not until about 150 that the term "scripture" was applied to any of the writings of the N.T.; after that date the advance was rapid. Marcion the Gnostic was the first to construct a canon of the N.T. consisting of the gospel of Luke (in an expurgated form) and ten epistles of S. Paul. Tatian's *Diatessaron* or Harmony of the Four Gospels dates from 165.

The Muratorian fragment of 170 is the first attempt on the part of Catholic Christianity to construct

Newt. 1. Male of common or smooth newt. 2. Underside of male British palmate newt. 3. Female and, 4, male of the large crested newt

a New Testament. It mentions—either by actual statement or inference—all the books of the N.T. with the exception of James, Hebrews, and 2 Peter. By 200 the majority of the documents in the N.T. had secured universal recognition in the whole of Christendom. The Western Church, however, rejected James and Hebrews, and the Eastern Church 2 and 3 John and Jude, while 2 Peter had not as yet won recognition at all. Some doubt, too, was expressed about the Apocalypse. Certain sections of the Church wanted to include in the N.T. such books as the Epistle of Clement, the Didache, the Shepherd of Hermas, etc.

Controversy with regard to the disputed books continued, and it was not until the 4th century that the matter was finally settled. Athanasius was the first great writer to use a N.T. identical with the present, and it was largely due to the influence of Augustine that this arrangement received the authoritative sanction of the Church at the synods of Hippo, 393, and Carthage, 397. *See Bible; Gospels, The Four; Paul.*

**Bibliography.** History of the Canon of the N.T., B. F. Westcott, 7th ed., 1896; Critical Introduction to the N.T., A. S. Peake, 1909; Text and Canon of the N.T., A. Souter, 1913; Introduction to the Literature of the N.T., J. Moffat, 3rd ed., 1918; The Four Gospels, B. H. Streeter, 1924; Christian Beginnings, F. O. Burkitt, 1924; Origin of the N.T., A. Harnack, Eng. trans. 1925; The Synoptic Gospels, C. G. Montefiore, 2nd ed., 1927.

**New Theatre.** London playhouse in St. Martin's Lane, W.C.2. Built and managed by Charles Wyndham, it was opened March 12, 1903, with a production of Louis Parker's Rosemary. It became one of the most popular West end theatres for drama and comedy, showing e.g. Henry of Navarre; Grumpy; The Wandering Jew; The Constant Nymph; Richard of Bordeaux. For several seasons it was the headquarters of the Old Vic company, which opened on Aug. 31, 1944, with a repertory including Shakespeare, Ibsen, and Shaw. The theatre seats 938.

**Newton.** District of Hyde, Cheshire. It is 7 m. S.E. of Manchester, with a rly. station. Cotton is the chief manufacture. Pop. 10,986. Another Newton in Cheshire is part of the urban dist. of Middlewich, and there are in England a number of villages of this name. One is near Wisbech, Cambridgeshire, and another, in the Isle of Wight, was long noted for its oysters.

**Newton.** City of Massachusetts, U.S.A., in Middlesex co. Situated on elevated ground on Charles river, close to Boston, it is formed of 14 villages, each with its own civic centre and rly. station. Manufactures include worsteds, silk, machine-shop products, cord, and rubber articles. Newton was settled in 1631, and incorporated under the name of Cambridge in 1688. It received its present name in 1692, becoming a city in 1873. Emerson and Hawthorne were notable residents. Pop. 69,873.

**Newton, ALFRED** (1829–1907). British zoologist. Born at Geneva,

June 11, 1829, the son of William Newton, M.P., he was educated privately and at Magdalene College, Cambridge. Having gained a travelling fellowship, he was able to study birds in many parts of the world. Returning to England, he was, in 1866, made professor of zoology and anatomy at Cambridge, where he remained until his death, June 8, 1907. Newton's Dictionary of Birds, 1893–96, is the standard work of its kind. He also wrote The Zoology of Ancient Europe, 1862; Zoology, 1872, 2nd ed. 1894; and was a frequent contributor to scientific journals.

## SIR ISAAC NEWTON

\* R. W. B. Stephens, Ph.D., Lecturer in Physics, Imp. Coll. of Science

*See the articles Energy; Gravitation; Light; Mechanics; Physics. Refer also to Relativity; Einstein; Kepler; and the biographies of other eminent physicists*

Isaac Newton was born at Woolsthorpe, Lincolnshire, Dec. 25, 1642, and educated at Grantham School. In 1661 he entered Trinity College, Cambridge, where he resided a year or more before he began to read mathematics. He proved an apt student, and by the early part of 1665 had made himself familiar with Euclidean geometry, geometrical conics, algebra, trigonometry, analytical geometry, and analysis as then studied; he also worked for his own amusement at optics and chemistry. In 1665 there was an outbreak of plague, and for a

Newton returned to Cambridge in 1668, having been elected to a college fellowship the previous year. For the next 30 years he lived in college, engrossed in the researches on which his fame rests. Soon after his return to Cambridge he was elected Lucasian professor, and as such lectured once a week in one term of each year, supplementing his instruction by personal interviews and the loan of manuscripts. The value of his work was widely recognized, and in 1675 the Crown issued letters-patent, permitting him to hold his fellowship without the necessity of taking orders. A short man with a broad forehead, a determined square jaw, bright blue eyes, and sharp features with a prominent nose, in character he was modest, deeply religious, and scrupulously just, but easily upset by controversy. A Whig, he disapproved of many happenings in James II's reign. His protest against James's attempt to force the university to award a master's degree to a Benedictine monk brought him before Judge Jeffreys. He was elected to the Convention parliament of 1689.

Newton left Cambridge in 1696, and during the rest of his career lived in London, holding offices in the Mint. These offices gave him a sufficient income; he enjoyed a well-appointed home, knew everyone he desired, and was universally honoured and esteemed. His reports on official matters show him as an acute and well-informed observer, but in science he produced nothing more of special note.

It was during this period that he became involved in two controversies, one on the question

After  
J. Vanderbank

*Isaac Newton*

couple of years he lived at home, though with occasional visits to Cambridge. Probably at this time his creative powers were at their highest. He had already discovered the binomial theorem, his use of fluxions may be traced back to 1665, his theory of gravitation originated in 1666, and the beginning of his optical discoveries would seem to have been made early in 1667.

whether Leibniz had discovered the infinitesimal calculus independently or had appropriated the idea from him, the other about the publication of Flamsteed's observations. He died at Kensington, March 20, 1727, and was buried in Westminster Abbey. He had been knighted in 1705, and was president of the Royal Society from 1703 until his death.

As regards his researches in pure mathematics, Newton dealt with most of the subjects then read, notably geometry and algebra. The evolution of the calculus was one of the great intellectual achievements of his day; this was invented by him, possibly also independently by others, though its introduction into general use was mainly due to Continental mathematicians. In geometrical optics, Newton developed the mathematical exposition, and for the first time offered an explanation of colour phenomena; he also invented a reflecting telescope, microscope, and sextant. These investigations led him to consider how light was produced, that is, to a theory of physical optics. In this he discussed the wave and corpuscular theories, rejecting the former, which, as then presented, failed to account for the rectilinear propagation of light, but admitting the latter as possible though not altogether satisfactory.

Newton's work on mechanics and gravitation is even more important, for it profoundly affected the ideas of men about the universe. He began with a discussion on the principles of mechanics, and proceeded to treat the motion of bodies in free space in known orbits or under the action of known forces, generalising the law of attraction into the statement that every particle of matter attracts every other particle with a force varying directly as the product of their masses and inversely as the square of the distance between them. Thus gravitation was brought into the domain of science, but what caused it Newton did not profess to know; and here, as in his theory of light, it was his object to present the theory free from speculation as to the mechanism that produced the phenomena.

Having investigated the general theory, Newton applied the results to the chief phenomena of the solar system, and showed that the facts then known about it and, in particular, the path of the moon with its various inequalities, the figure of the earth, and the motion of tides, accorded with the theory

Newton's work has stood the test of modern theory and practice, for even Einstein's work on relativity has shown that the mechanics developed by Newton are merely a particular case of a much more general formulation of the laws of motion and gravity. Again, Newton anticipated wave-mechanical theory to a certain extent, for he associated particles with the formation of sharp optical shadows, while to explain the colours of their films he assumed light to possess some periodicity.

*Bibliography.* Correspondence of Newton and Cotes, ed. J. Edleston, 1850; Life, D. Brewster, rev. W. T. Lynn, 1875; Bibliography of the Works of Newton, G. T. Gray, 2nd ed. 1907; Lives, L. T. More, 1934; J. W. N. Sullivan, 1938; Sir J. Craig, 1946.

**Newton, JOHN** (1725-1807). English divine. Born in London, July 24, 1725, he had a varied career at sea, and was ordained in 1764.

John Newton,  
English divine  
After J. Russell, R.A.

He became in 1780 rector of S. Mary Woolnoth, London. He was a friend of Cowper, who contributed to his Olney Hymns, 1779. He helped Wilberforce in the campaign against the slave trade. Of his hymns, Glorious things of Thee are spoken, and How sweet the name of Jesus sounds, are among the most widely known. He died Dec. 21, 1807.

#### Newton

##### Abbot.

Urban dist. and market town of Devonshire, England. It is 16 m. from Exeter, and has a rly. junction. The town stands amid beautiful scenery at the head of navigation of the Teign estuary. The chief buildings are the churches of S. Mary, Woolborough, and All Saints,

Highweek, both Perpendicular. The industries include clay mining and leather dressing; there are railway workshops. Forde House, a Jacobean building, was visited by both Charles I and William of Orange. In the centre of the town is the tower of S. Leonard's church, near which William of Orange's first declaration to the English people was read, 1688. Newton Abbot comprises what, in the Middle Ages, were two distinct places: Newton Abbot, the property of the abbot of Tor, and Newton Bushel, the property of the family of Bushel. Market day, Wed. Pop. 15,000.

**Newton Heath.** Suburb of Manchester, England. It lies to the N.E. of the city and is served by railway and public road transport. See Manchester.

**Newton-le-Willows.** Urban dist. of Lancashire, England, formerly known as Newton-in-Makerfield. Approximately midway between Liverpool and Manchester, it is a rly. junction. Factories in the dist. include rly. vehicle and locomotive works, a sugar refinery, and printing works. The dist. is in the Newton parl. div. Pop. 21,140.

**Newton's Rings.** Term referring to an optical interference phenomenon, described by Newton in 1675. The rings are analogous to colours seen in films of oil on wet pavements, in soap bubbles, etc. When a spherical and slightly convex lens is pressed into contact with a plane glass surface, a series of coloured rings are seen by reflected white light surrounding the point of contact. The effect is caused by interference between light reflected at the upper end and that reflected at the lower surface of the air films which separate the lens and plate.

**Newton Stewart.** Police burgh and market town in the heart of Galloway, Scotland. It is mainly in Wigtownshire, with one suburb in Kirkcudbrightshire. It is on the river Cree, 30 m. W. of Castle Douglas by rly. Pop. 1,914.

**Newtown** (Welsh, *Trefnewydd*). Urban district and market town of Montgomeryshire, Wales. It stands on the Severn, 7 m. W.S.W. of Montgomery, on the rly. and the Montgomeryshire canal. It was the principal seat of the Welsh flannel industry, making tweeds and shawls, but is now mainly a marketing and residential place. S. Mary's church, with its tower built in the 13th century, stands by the river. The council controls the water supply. Market days, Tues. and Sat. Pop. 5,152.

Newton Abbot. S. Leonard's church tower. A lamp-post surmounts the pedestal from which William III was proclaimed king in 1688

**Newtown.** Suburb of Sydney, N.S.W., Australia. A major manufacturing and industrial centre, it contains also the university buildings and colleges. Pop. est. 26,000.

**Newtownards.** Market town of co. Down, N. Ireland. It is 1 m. from the head of Strangford Lough

Newtownards arms

and 14 m. E. of Belfast on the Belfast and County Down rly. The chief buildings are the town hall, parish church, a fine cruciform building, and a number of other churches. Of the old church, the nave, tower, and an aisle still stand. Women and girls weave muslin, flax and hemp yarns are produced, and there are hosiery works. Market day, Sat. Pop. 10,545.

**Newtown Stewart.** Market town, co. Tyrone, N. Ireland. It stands on the river Mourne, 24 m. by rly. S. of Londonderry. The town was granted to William Stewart, after whom it was named, by Charles I.; the castle was dismantled, and the town burned down by James II. Here is Baron's Court, residence of the duke of Abercorn. Linen is woven in the town. Market day, Mon.

**New Westminster.** Town of British Columbia. It is 12 m. S.E. of Vancouver, is served by C.P.R., C.N.R., and other rlys., and stands on the Fraser river, here about a mile wide, 15 m. above the mouth, at the head of the delta. Salmon canning and the dressing and shipping of timber are carried on at the largest fresh-water port in the prov. Founded in 1858 by Colonel Moody, the town was, before British Columbia became a prov. of Canada, the capital of the mainland. Pop. 44,359.

**New Year's Day.** First day of the year. The ancient Attic year began with the new moon after June 21, and the Romans opened their year on March 1. The beginning of the Roman year was changed by Julius Caesar to Jan. 1. In England the Anglo-Saxon year started with Dec. 25; this was altered at the Conquest to Jan. 1. In the Middle Ages the Christian year began generally on March 25 until the adoption by R.C. nations of the Gregorian calendar in 1582, by England not until 1752, when Jan. 1 became New Year's Day. Among customs observed on New Year's Eve and Day in England, Scotland, and elsewhere may be mentioned the ringing of the church bells at midnight, and Hog-

manay (q.v.). In Scotland, where Jan. 1 is a bank holiday, and in parts of England "first footing" survives; the first person who enters the house on New Year's Day brings good luck according as, in different localities, he is light or dark haired.

**New York.** State of the U.S.A., usually called the empire state. It includes many adjacent islands, of which Long Island, Staten Island, and Manhattan Island are the chief. The surface is diversified. In the W. and centre, approaching Lakes Erie and Ontario, it consists of a level tract, part of which belongs to the Allegheny plateau. The central portion contains the "finger lakes" (Canandaigua, Seneca, Cayuga, and several others), which occupy narrow depressions formed by the Laurentian glaciers.

The mountainous regions of the E. are separated by the Mohawk, whose valley connects at right angles with those of Lake Champlain, Lake George, and the Hudson. N. of the Mohawk lies the picturesque Adirondack range, which attains in Mt. Marcy an alt. of 5,345 ft., and S., to the W. of the Hudson river, are the Catskill group (highest summit, Slide Mt., 4,205 ft.), and an extension of the Pennsylvanian Mts. The principal rivers are the Hudson, flowing N. to S., its right bank affluent the Mohawk, the St. Lawrence, which forms part of the N. delimitation, the Delaware, Niagara, Oswego, Black, and Genesee. Numerous lakes occur in the Adirondack Mts.,

and the rivers are noted for their picturesque falls. Waterway communication is maintained between Albany on the Hudson and the St. Lawrence and Great Lakes by means of the Champlain Canal to the N. and the New York State Barge Canal to the W.

New York became an independent state on April 20, 1777, and was one of the original 13 states of the U.S.A. It is divided into 62 administrative counties. It is primarily a manufacturing state, and its exceptional means of transport by the lakes, rivers, 525 m. of canals, 7,653 m. of steam and 326 m. of electric rlys. (excluding New York city), 14,136 m. of highway, and over 160 airports, make it the greatest commercial state of the Union. The leading industries are clothing, automobile, flour, tobacco, paper, wood pulp, boot and shoe, and machinery manufactures, printing and publishing, bread making, brewing, and slaughtering and meat packing. Next to manufactures, agriculture is of chief importance, and mining also is a valuable interest. Saline, chalybeate, sulphur, and other springs are found in various parts of the state. Higher education is provided at several universities and a large number of colleges. Two senators and 45 representatives are returned to congress. New York City, Buffalo, Rochester, and Syracuse are the principal cities, and Albany is the capital. The area is 49,204 sq. m. and the population is estimated at 12,632,890.

## NEW YORK: AMERICA'S LARGEST CITY

Marie McGowan, formerly of the New York Herald Tribune

*The physical features, industries, and business activities, social and political developments of New York City, described by a writer who knows it well. See also entries under districts, notable buildings, etc., e.g. Broadway; Bronx; Brooklyn; Ellis Island; Liberty; Manhattan; Rockefeller Centre*

New York is the second largest city in the world in pop. and area, the largest in the U.S.A. and in the western hemisphere, and the world's greatest port. It is the largest manufacturing centre in the U.S.A. and the nation's business, commercial, financial, and cultural capital.

New York City arms

In its financial district, Wall Street, is concentrated control of banks, rlys., utilities, and all manner of industrial and other enterprises in every state of the Union and in every country in the world.

The city is situated on the Atlantic seaboard, in the S.E. corner of the state of New York. The city proper has an area of 322.83 sq. m., with an extreme length, from N. to S., of 36 m. and an extreme breadth of 16½ m. The metropolitan area, i.e. the territory within a radius of 40 m. from the city hall, includes parts of the state of New Jersey to the W., Westchester co. and the state of Connecticut to the N. and N.E., and Long Island to the E. Pop. of the city (1940) 7,454,995; (1948, est.) 7,888,000. Pop. of the metropolitan area (1940) 11,690,520; (1947, est.) 13,580,000.

The city owes its rapid rise to maritime pre-eminence to its mag-

NEW YORK CITY: PLAN OF MANHATTAN FROM BATTERY PARK TO RADIO CITY, AND MAP OF COMPLETE CITY AREA WITH ENVIRONS

nificent harbour and to its location at the mouth of the navigable Hudson river which, by means of its connexion with the New York state barge canal system, provides an outlet to the Atlantic for the wheat, coal, lumber, and heavy industrial products from the Great Lakes area and the Middle West. The harbour is well protected, open throughout the year, deep enough for the largest ships, and vast enough to accommodate the whole U.S. navy without much inconvenience to regular commercial vessels. Broadly considered, it includes all the navigable waterways within a radius of 25 m. from the statue of Liberty on Bedloe's I. in the Upper bay. It consists of 771 m. of direct shore line on navigable water, about 578 m. of which are within the city proper. Narrowly considered, the actual harbour consists of the Lower bay, the Narrows, and the Upper bay, which provide a 17-m. channel from the ocean to the Battery, at the S. end of Manhattan I. Ships of all the world crowd the sea lanes in the world's busiest port. The total tonnage of cargo which passes through the port each year is approx. 120,000,000. During the Second Great War, 60 p.c. of all the cargo shipped from the U.S.A. by water went through the waterways and docks of New York.

#### Communications and Industries

Twelve railway systems terminate in New York, either at the two magnificent terminuses in the city itself, Grand Central terminal and the Pennsylvania station, or at terminuses in New Jersey, across the Hudson.

With the completion of the larger part of the New York international airport, formerly called Idlewild airport, in Queens, New York has become the world's greatest international air-traffic terminus. With the addition of the new airport facilities to those of La Guardia field, also in Queens, the city is able to receive and dispatch a total of 58,000,000 air travellers a year. Newark airport and seaport in New Jersey is another large and important unit in the metropolitan area's termini of the world's airlines.

Virtually every commodity is processed or manufactured in some part of the metropolitan area and every industrial process is carried on. The New York industrial area, by far the country's largest, has more manufacturing industry than Chicago, Philadelphia, Cleveland, and St. Louis together: 75 p.c. of U.S. clothing is made here, virtually

all women's clothing being designed and made in New York.

The area's leading industries, in the order of value of the products, are: manufacture of women's frocks; smelting and refining of non-ferrous metals; manufacture of coats, costumes, and skirts; manufacture of bread and bakery products; meat packing; petroleum refining; manufacture of men's suits and coats; manufacture of motor vehicles, bodies, and parts; publishing of periodicals; and manufacture of fur coats and other garments and accessories.

New York's prestige was enhanced by its acquisition of the status of a kind of world capital, with the setting up there in 1946 of the temporary H.Q. of the United Nations and the selection of a site in the mid-town section of the E. side of Manhattan as the permanent H.Q. into which it was to move in 1951.

#### "The World's Largest"

The city has the world's tallest buildings, having developed the skyscraper, invented in Chicago, in a way that has made it New York's contribution to architecture and the symbol of her aspirations and achievements. It has the world's largest office building (the R.C.A. building in Rockefeller Centre), the largest indoor theatre (the Radio City music hall, which seats 6,200), the largest departmental store (R. H. Macy and Co.), and the world's largest housing project (the Parkchester group of blocks of flats in the borough of the Bronx, constructed by the Metropolitan Life Insurance Co. and accommodating 45,000 people). Broadway, which zigzags the whole length of Manhattan from the Battery to the N. boundary of the city, is 18 m. long.

The city's budget, which reached \$1,000,000,000 (£250,000,000) in 1947-48, is far larger than that of any of the 48 states of the U.S.A. or of any other city. New York surpasses all other cities in the world in the size of its system of free education from six to 21 years of age, the elaborateness of its water-supply, and the number of its telephones, more than all the telephones of France, or Canada, or Sweden, or the U.S.S.R. It has the largest police force in the world, and the largest municipally owned and operated transport system in the U.S.A.

New York is the world's greatest centre of Jewish pop., the Jewish element numbering about 2,000,000. It is the world's negro metropolis, with 500,000 negro residents, some 325,000 of them

crowded into Harlem, on the upper West Side of Manhattan. It has more Italians than any city outside Italy; and it is the world's third Irish city. The polyglot pop. includes representatives of every nationality, race, colour, and creed in the world. The foreign white pop. in 1940, i.e. foreign-born and American-born of foreign or mixed parentage, was 4,831,580. The most important elements of this segment of the pop. in order were Italian, Russian, German, Irish, Polish.

#### Famous Skyline

Comparatively few relics and historic sites have been spared in the city's march to commercial supremacy, and even these go back at the most, only three centuries. The city has, however, a peculiar beauty of the 20th century, and its skyline, seen from a trans-Atlantic liner in the bay, from Queens across the East river at night, from Brooklyn heights, or from the Staten I. ferry, is an unforgettable scene.

Behind this coruscating façade there is much poverty, squalor, and ugliness. From 1933, however (notably during La Guardia's mayoralty 1934-45), the city has enjoyed far-reaching socio-economic as well as political reform and progress. With funds, provided chiefly by the federal govt.'s public-works projects instituted by President F. D. Roosevelt, La Guardia spurred the construction of new bridges, parkways, tunnels, housing projects, hospitals, schools, and playgrounds. Outstanding among these achievements were the several low-cost housing projects in all boroughs except Richmond, providing well-ventilated, well-equipped flats at low rents for former tenement dwellers, and the parkways and drives, especially the W. side Express highway and the Henry Hudson parkway along the Hudson, and the Franklin D. Roosevelt drive, formerly the East River drive, on the other side of Manhattan I., which, besides easing the traffic problem, transformed the waterfronts on the E. and W. boundaries of the island.

The city proper, which was consolidated in its present form on Jan. 1, 1898, consists of five boroughs, Manhattan, the Bronx, Brooklyn, Queens, and Richmond, of which only the Bronx is on the mainland. Brooklyn and Queens, separated from Manhattan I. by the East river, are on the E. end of Long I. The Bronx is N. of Manhattan, across the Harlem

river, and Richmond embraces Staten I., which is S.W. of Manhattan, across the Upper bay. The five boroughs are co-terminous with counties of New York state, Manhattan being New York co., Brooklyn Kings co., the others having the borough names.

To all intents and purposes, Manhattan I. is New York, the other boroughs being in varying degree its suburban residential satellites. There has been an exodus to the comparatively rural outlying areas in recent years, but Manhattan retains the most fashionable residential sectors and its pop. of 1,889,924 (1940) was second only to that of Brooklyn.

Brooklyn (*q.v.*) was an independent city until 1898. The New York navy yard is there.

The Bronx, third in pop. with 1,394,711, is called the "borough of universities." Its institutions of higher learning include divisions of New York university; of Hunter college, the world's largest women's college; and of Fordham university, a Jesuit institution.

Queens, which ranks first in size (126.6 sq. m.) and fourth in pop. (1,297,694), is the site of the two international airports and of the temporary meeting-place of the U.N. general assembly, Flushing Meadow park, where the New York world's fair of 1939-40 was held.

Although it is the third largest borough, Richmond had a pop. (1940) of only 174,441, which includes the city's highest percentage (74 p.c.) of native residents.

Manhattan I. is the heart of this sprawling metropolis. Thousands of suburban residents travel here daily to work from all parts of the metropolitan area. The transport facilities include 20 bridges, the most notable being the old Brooklyn and the new Triborough bridges across the East river and the George Washington bridge across the Hudson, and 18 tunnels, including the Holland and Lincoln tunnels under the Hudson and the Queens-Midtown tunnel under the East river. The Brooklyn-Battery tunnel under the East river, which took 10 years to construct, was opened in 1950. It is 1 m. 279 yds. in length.

The New York transport system also includes tube trains under the Hudson, scheduled ferry crossings and, within the five boroughs, three city-owned underground rlys. or subways, and elevated rly., trolley, and bus lines. A uniform nickel fare (five cents or 2½d.) for any distance travelled was charged by the subway 1904-48, when it

was doubled, the subway having long been run at a loss.

All trolleys and trams have been done away with on Manhattan I., where surface transport is by single-fare buses. The subway is woefully overcrowded; other facilities for travel from E. to W. are also inadequate.

Manhattan's streets are laid out in the gridiron pattern usual in most U.S. cities, with numbered streets running from E. to W., except in the extreme S. end and in Greenwich Village, where the pattern of named streets and occasional numbered ones is erratic. Most of the avenues, which run N. and S. from river to river, are numbered, although a few are lettered and others, such as Park, Lexington, Madison, are named. Fifth avenue divides the island into its E. and W. sides, the street numbers beginning at Fifth avenue. The system of consecutively-numbered streets and avenues makes it easy to find the way in Manhattan.

#### Manhattan from S. to N.

A trip up Broadway from the Battery to the Bronx, with occasional side excursions to the E. or W., gives a glimpse of the immensely concentrated and varied life of Manhattan and of its most famous sights. At the Battery, so-called because the British built a fort there in 1693, is a pleasant park and the abandoned aquarium, a gloomy structure, to be supplanted by a new aquarium at Coney I., Brooklyn. The Whitehall district just N. includes not govt. buildings, but the offices of steamship lines; Bowling Green, where, legend says, Peter Minuit, director-general of New Netherland, purchased Manhattan in 1626 from the Indians for trinkets worth \$24; the U.S. custom house, which houses the offices of the collector of customs of the port of New York and other federal agencies; and Frances tavern, one of the island's hallowed landmarks, where George Washington bade farewell to his officers in 1783. On West street, bordering the Hudson, docks, sheds, and loaded lorries give evidence of the port's ceaseless activity. The city's wholesale food markets are here.

A little farther N. is the Wall street area, which is symbolised by the soaring skyscrapers which make canyons of the narrow streets. Skyscrapers were erected here in the first place to satisfy the demand for office room in this strategic area and to take advantage of the island's rock-ribbed foundation.

The 950-ft., 66-storey, 60 Wall Tower and the 927-ft., 71-storey bank of Manhattan building are the third and fourth highest structures in the city, taller being the 1,248-ft., 102-storey Empire State building at Fifth avenue and 34th street, and the 1,046-ft., 77-storey Chrysler building at Lexington avenue and 42nd street. Other landmarks are the New York stock exchange, the U.S. sub-treasury building, where Washington took the oath as president of the U.S.A. in 1789, and Trinity church, an incongruity amid the vast expanses of steel and stone, which became perhaps the wealthiest Protestant Episcopal church in the world and owner of a substantial parcel of lower Manhattan as a result of a land grant by Queen Anne in 1705.

Farther N. is New York's civic centre, dominated by the city hall, the third in the city's history. An Italian Renaissance structure, set in a small park where the declaration of independence was read to the American army in 1776, it was dedicated as the seat of city govt. in 1812. Overshadowing the city hall is the 40-storey municipal building, site of many municipal offices and of the city's broadcast station; in the area are the U.S. court house, the state supreme court building, the city's new criminal courts building, and prison and police h.q. To the east, behind police h.q., is Chinatown, where 5,000 Chinese live and conduct business, and where their children attend the Chinese school, which is part of the city's system, and where they learn Chinese after regular classes. On the edge of Chinatown is the Bowery, a drab thoroughfare famous for the drink-sodden, down-and-out derelicts who frequent it. Somewhat to the N. and farther E. is the lower E. side, long notorious for the slums in which many of the city's poorest foreign-born residents are concentrated. Housing projects have somewhat improved the area.

Farther N. in the centre of the island is Washington square, one of the city's few squares, where Fifth avenue begins, and Greenwich Village, which clings tenaciously to its reputation as the Bohemian home of unsung artistic and literary genius. In the twenties and thirties, on the W. side, is New York's vast wholesale clothing industry.

The area between 34th and 59th streets, embracing most of the E. and W. sides, is the heart of the heart of New York, a concentra-

#### NEW YORK: ITS FAMOUS SKYLINE AND SOME OF ITS LOFTIEST TOWERS

tion of the best which the city has to offer in the theatre, music, other kinds of entertainment, and the purveying of luxury in all its forms. At 34th street and Fifth avenue are the first of the luxury departmental stores, while to the W. are the Pennsylvania station and the New York post office, both huge structures.

Beginning at 42nd street on the W. side is the Times square district, of which the centre is New York's Piccadilly, where crowds gather on New Year's Eve and election night. The theatres are not on Broadway, but in the side streets just E. and W. of it. At Fifth avenue is the squat structure of the New York public library, in front of which are two seated stone lions. Just E. is the Grand Central district, dominated by the terminus. At the E. end of the island, bordering on the East river, is the site purchased by John D. Rockefeller, Jr., and presented to the U.N. for the world organization's h.q.; it was formerly crowded with tenements, abattoirs, and garages. The upper E. side from the 50s to the 90s, notably Sutton and Beekman places and the mid-section of Park avenue, contains the city's smartest houses and flats.

Facing Fifth avenue, and extending from 48th to 52nd streets and W. to the avenue of the Americas (formerly Sixth avenue) is Rockefeller centre (*q.v.*). Across Fifth avenue is S. Patrick's cathedral, a Gothic Revival structure, seat of the R.C. archdiocese of New York.

Central park, the city's largest, has an area of 840 acres and extends  $2\frac{1}{2}$  m. from 59th street to 110th street, the fringe of Harlem, and  $\frac{1}{2}$  m. from Fifth avenue to Central park W. It contains a zoo, much smaller than the city's principal zoo in the Bronx. Near are the Metropolitan museum of art, containing America's most comprehensive art collection, the American museum of natural history, and the Hayden planetarium.

On the E. end of the island, are the buildings of the Rockefeller institute for medical research, and the striking group of 15 structures of the New York hospital and the Cornell university medical college. At the edge of Yorkville, the German section, is Carl Schurz park.

At E. 96th street begins the three-square-mile expanse of the city's largest and worst slum area, Harlem, where approx. 325,000 negroes, 250,000 Puerto Ricans, Cubans, Mexicans, and other Latin Americans, and 250,000 Italians

live, several families or as many as 20 persons sharing one four-room flat. There are three sections, called negro, Spanish (a misnomer), and Italian Harlem, of which the last, only a square mile in area, is Manhattan's most densely populated section and the country's largest Italian-American colony. Relieving the squalor of negro Harlem are the Harlem river houses, Manhattan's first large-scale low-income housing project, constructed by the federal govt. in 1937, another development financed by John D. Rockefeller, Jr., and the blocks of flats in the Sugar Hill section where negro celebrities—musicians, composers, writers, actors, and prize fighters—live in segregated affluence.

At the W. extremity of Manhattan I., Riverside drive is no longer a fashionable residential section, but it and the 11-m. Henry Hudson parkway along the Hudson form one of the island's most attractive highways. Crowning Morningside Heights and extending along Broadway between 116th and 120th streets are the 69 buildings which form the main portion of Columbia university. Also on Morningside Heights is the cathedral of S. John the Divine, seat of the Protestant Episcopal diocese of New York, begun before 1900 and still unfinished after more than half a century.

The notable smaller islands in the waters around Manhattan include Bedloe's, Ellis, and Governors Is. in the Upper bay and several in the East river. On Bedloe's I. stands one of the first sights seen by passengers arriving in New York, Bartholdi's figure of Liberty Enlightening the World, universally called the statue of Liberty. Ellis I. is the h.q. of one of the nation's 22 immigration and naturalisation districts. Governors I., site of the "pleasure house" of the British colonial governors of New York, is the h.q. of the First army, with jurisdiction over New York, New Jersey, Delaware, and the New England states. On Welfare, Ward's, Riker's, and Randall's Is. in the East river, which is actually not a river but a tidal strait or salt-water estuary, are hospitals, a model penitentiary, a large sewage-disposal plant, and the Triborough stadium, which accommodates 30,000 spectators.

#### History of the City

Manhattan I., where all that New York is most famous for is concentrated in 31.2 sq. m., was discovered by Henry Hudson, exploring on behalf of the Dutch

East India Co., in 1609. The first houses for white men were built two years later, and the settlement, called New Amsterdam, was incorporated as a city in 1653, when its pop. was about 800.

After more than half a century of Dutch rule, the city was captured by the English in 1664 and was included in the grant of all the Dutch land in America which Charles II gave to his brother James, then duke of York. It was in honour of James that the city was then renamed as New York. In 1673, the Dutch recaptured it, but 15 months later, New Netherland, including the city, was ceded to the English. In 1686, the first charter was granted and the first newspaper was founded in 1725. During the revolution, the city was taken by the British in 1776 and the Americans did not regain control of New York below 14th street until 1783. In 1784, Governor George Clinton appointed James Duane as the first mayor of the independent American city.

New York was the capital of the U.S.A. from 1785 to 1790; in the latter year, the pop. was 33,131 and the city limits were the Battery and the S. boundary of City Hall park. It was the capital of the state until 1797.

#### Administration of the City

The city govt. is vested in elected officials, headed by the mayor, who is administrator and policy-maker, members of the city council, which is the legislative body, and members of the board of estimate, who include, besides the mayor, the comptroller, the president of the council, and the five borough presidents. Judges of the higher courts are elected, others are appointed by the mayor.

Two of the city's daily newspapers which influence national opinion and reflect American opinion internationally are the New York Times and the New York Herald Tribune (*q.v.*). The latter has a European edition, published in Paris. The New York Daily News, an isolationist "tabloid," has the largest circulation of any U.S. newspaper.

The city's recreational facilities include 20,300 acres of parks, comprising 10 p.c. of the city's area and of its assessed valuation; 65 m. of landscaped parkways which have no intersections and are restricted to pleasure vehicles, and several beautifully-designed and well-kept beaches, notably Jones beach on Long I., with which the famous Coney I., in Brooklyn, does not bear comparison.

**NEW YORK: BUILDINGS AND STREETS IN THE METROPOLIS OF THE U.S.**

**New York Bay.** Inlet on the Atlantic coast of the U.S.A. It comprises the upper and lower bays, connected by a channel called The Narrows. The upper bay lies at the mouth of the Hudson river, and on its shores is the city of New York. It is joined to Newark bay by a channel called Kill Van Kull. The lower and larger bay separates Long and Staten islands from the mainland of New Jersey.

**New Yorker.** THE. Satirical and literary U.S. weekly magazine. First issued in Feb., 1925, it was edited by Harold Ross, who was also chief owner. The laconic style of New Yorker contributors reflected from the first the disillusionment with war which prevailed in the 1920s; the style has been maintained, with frank enjoyment of American prosperity added. The New Yorker style of pictorial joke, characterised by a minimum of written explanation and the concentration of attention on the joke at the expense of visual accuracy, revolutionised comic art on both sides of the Atlantic.

**New York Herald Tribune.** THE. American daily and Sunday morning newspaper which resulted from the merger, in 1924, of the New York Tribune, established by Horace Greeley, April 3, 1841, and the New York Herald, started by James Gordon Bennett, May 6, 1835. Greeley was succeeded as chief proprietor and editor of the Tribune by Whitelaw Reid, who had been a war correspondent during the Civil War and U.S. minister to France and Great Britain. His son, Ogden Reid (1882-1947), effected the merger with the Herald. The Reid family combined the technical progressiveness of the Tribune with the enterprise of the Herald, which secured an exclusive account of Gettysburg in 1863 and sent Stanley in 1869 to find Livingstone. In editorial policy the paper preserves a conservative Republican stand on domestic affairs but is progressive in its international outlook. Thus it opposed President F. D. Roosevelt's New Deal, and advocated all-out aid to Great Britain long before Pearl Harbour. After the liberation of Paris, 1944, it revived its European edition, founded by Bennett in 1887 and known as the Paris Herald. The offices are at 230, West 41st street.

**New York State Barge Canal.** Largest artificial waterway in the U.S.A. From Buffalo on Lake

Erie to Troy on the Hudson river, it is 352 m. in length, to which its Oswego, Cayuga-Seneca, and other tributaries add another 173 m. It is served by 57 locks, and minimum depth is 12 ft. Opened in 1918, supplanting an earlier system, the canal enables cargoes to travel from New York to remote ports on the Great Lakes without transshipment. Modernisation required the abandonment of part of the old Erie Canal, which was the principal unit in the system, and the canalisation of the Oneida, Oswego, Mohawk, and Huron rivers, whose levels were altered and dammed at a cost of £30,000,000. Its great mass of commerce, flowing both inward and outwards, consists largely of petroleum, lumber, wheat, and molasses; lake carriers take coal, iron, motor cars, and grain to ocean ports. Total canal tonnage in 1939 was 4,689,037.

**New York Times.** THE. American Independent Democratic daily and Sunday morning newspaper, established by H. J. Raymond (a former member of the editorial

staff of the New York Tribune), Sept. 18, 1851. Adolph Ochs was owner from 1896 until his death in 1935, whereupon his son-in-law A. H. Sulzberger succeeded. The paper publishes, as part of its Sunday edition, a notable literary supplement and Times Magazine. Its motto is: "All the news that's fit to print." Its offices are at 229, West 43rd street. For its objective reporting the paper stands in esteem above all others in the city except the New York Herald Tribune, and exercises more influence than is suggested by its Sunday sales of one million.

**New York University.** Educational institution of the U.S.A. Its work is carried on partly in old buildings in Washington Sq., partly in newer halls and lecture rooms on University Heights in the Bronx. Founded in 1831 and privately endowed, it is the second largest educational institution in the U.S.A. The teaching staff exceeds 1,800 for over 40,000 students. Its Hall of Fame, with statues of noted Americans, overlooks the city.

## NEW ZEALAND: A BRITISH DOMINION

\* Walter C. Smith, writer on Imperial Affairs

*This Encyclopedia contains articles on Dunedin; Wellington; and other places and physical features of note in the Dominion. See the biographies of Low, David; Mansfield, Katherine; Seddon, and other New Zealanders; also Geyser*

New Zealand (Maori *Ao Tea Roa*, the long white cloud) is a British Dominion in the South

New Zealand arms

Seas. It is approx. 1,200 m. E. of Australia, 6,000 m. W. of S. America, and 1,600 m. N. of the Antarctic continent. It embraces North and South Islands, the small Stewart I. separated from the S. end of South Island by Foveaux Strait, and many small islands in the neighbouring seas, of which the Auckland and Kermadec groups, and the smaller Campbell, Three Kings', Antipodes, and Bounty islands are uninhabited; the Chatham and Cook groups contain over 18,000 people. New Zealand also holds the mandate for the former German colony of Western Samoa. The area of New Zealand, with adjacent and outlying islands, is 103,935 sq. m. The area of the N. Island, with adjacent islets, is 44,281 sq. m., and of the S. Island, with adjacent islets, 58,093 sq. m.

The pop. of N.Z. at the 1945 census was 1,702,298, 1,603,554 whites and 98,744 Maoris. The pop. of the four largest towns (1947) was Auckland, 281,900; Wellington, 183,100; Christchurch, 159,400; Dunedin, 87,700.

Physically the islands of N.Z. form part of the great festoon of islands which begins at New Guinea, ends at Antipodes I., and includes New Caledonia. They are separated by the deep Tasman sea from the E. coast of Australia.

South Island consists of a great mt. range, the Southern Alps, a vast system which includes alps or summer pastures, alpine lakes, glaciers, and snowfields. Mt. Cook (Maori *Aorangi*, sky piercer) is 12,349 ft.; and 17 other peaks are more than 10,000 ft. The W. slopes almost reach the shore, and are clothed with mighty fern forests; in the S., Milford sound is the best known fjord; the E. slopes reach the Canterbury Plains.

North Island consists of a highland reaching from Mt. Egmont in the S.W. to East Cape in the N.E., and two peninsulas—one a lowland terminating in the N.W. in Cape Maria van Diemen. the

other mountainous and reaching Cook Strait. None of the mountain ranges is related to the Southern Alps; the Ruahine and Tararua ranges of the S.E. peninsula are, however, related to the Kaikouras ranges in the N.E. of South Island.

The Rotorua district is world-famous for its hot springs, geysers, and sinter terraces, where the Maoris cook potatoes by dipping them in the boiling springs. Of the volcanoes, snow-capped Ruapehu, 9,175 ft., has at its summit a crater lake of warm water, which boils and is heaved into the air and splashes the surrounding ice cliffs; Ngauruhoe, 7,515 ft., and Tongariro, 6,140 ft., are quiescent; Mt. Egmont, 8,260 ft., is extinct; Whakaari, White Island, in the bay of Plenty, is active. In South Island there are hot springs, which occasionally bubble into icy cold water flowing away from a glacier snout. Lakes Taupo, 238 sq. m. in extent, and Rotorua in North Island differ in character from Wakatipu, 114 sq. m., Te Anau, 132 sq. m., and the smaller alpine lakes of South Island. Of the S.I. glaciers Tasman, 18 m. long, is reputed to be the largest glacier outside the Polar regions; Murchison, 11 m. long, is next in size. The Waikato and Wanganui in N.I., and Clutha, Buller, and Grey in S.I. are the chief rivers. Few of N.Z.'s rivers are navigable: they are swiftly flowing and their issue into the sea is usually obstructed by formidable bars.

The climate is equable and provides probably the best example in the world of the insular type. There is an average of about 2,000 hrs. of sunshine a year, c. 600 hrs. more than in Great Britain. N.I. is warmer than S.I.: at Auckland the mean temps. of the warmest and coldest months are 66° F. and 52° F.; at Dunedin 59° F. and 43° F. The rains are sufficient; in N.I. they exceed 35 ins. everywhere, in S.I. the W. coast is very wet, over 100 ins. annually at Hokitika, and the E. plains are dry, the Canterbury Plains having less than 30 ins. The indigenous animals include two kinds of bat, the only land mammals; kiwis, penguins, and other birds which cannot fly, keas, cormorants; lizards, butterflies, and moths. Europeans introduced the farm and domestic animals; deer, trout, pheasants, and quail; rabbits, stoats, and weasels, which became a scourge.

The flora is essentially of the forest type; the tree ferns of Westland grow in great profusion;

the kauri of the N., which reaches a height of more than 200 ft., the rimu, and similar trees are due to the heavy rains; the beeches of S.I. are a mountain type; New Zealand flax or phormium is a characteristic swamp growth. The only native grasses are tussock grasses; the turf grasses have all been introduced, chiefly from English seed.

The dominant industry is sheep rearing; parts of N.I. in the Wellington peninsula have

New Zealand. Map of the British Dominion, S.E. of Australia, in the S. Pacific Ocean

more sheep per sq. m. than any equivalent area in the world. At first meat was only a by-product; but when research in N.Z. produced refrigerating experiments and at last a satisfactory method was evolved for refrigerated steamships, Canterbury lamb became a highly important export. Dairy farming with its products, butter and cheese, are of growing importance. During 1947, N.Z. exported to Great Britain 82,720 tons of cheese and 120,309 tons of butter. Crops of wheat, oats, and barley are grown for local consumption. Kauri gum is dug in the Auckland pen., phormium is gathered from both wild and cultivated plants, timber is cut from the forests. Coal is mined on the W. coast of S.I., and gold in the Thames pen. In the valley of the Clutha, alluvial gold is dredged; New Zealanders were the pioneers in constructing dredgers suitable for such work.

A growing rly. system connects the chief towns. It is supplemented by a coastal steamer service, and a system of good

roads. N.Z. has more motor vehicles in proportion to her pop. than any other country except Canada and the U.S.A. The total number of motor vehicles in use, excluding official vehicles, was 315,500 in 1946.

The principal exports in order of value are wool, butter, frozen lamb, cheese, sheep skins, frozen mutton, seeds. The total value of the exports in 1946 was just under £100,000,000, of which 70 p.c. went to Great Britain and over 11 p.c. to other British countries. The total value of imports was £71,634,000, of which 47.7 p.c. came from the U.K. and 29.1 p.c. from other British countries. Principal imports are textiles, producers' equipment, including machinery and electrical goods, producers' materials, transport equipment, and manufactured foods. Wheat and sugar are also imported.

CONSTITUTION. The Dominion, officially a colony from 1840 to 1907, is an independent, self-governing member of the British Commonwealth of nations with high commissioners in London, Canberra, and Ottawa, ministers in Washington and Moscow. N.Z. is governed by a gov.-gen., who is the personal representative of the king, but is in no way subject to the British govt. The N.Z. parl. system is modelled on that of the

U.K. The legislative council, or upper house, consists of 35 members who held office for life until the period of service was reduced to seven years. The members are nominated by the gov.-gen., on the advice of the govt. The council has no power to initiate or amend legislation imposing taxes or affecting revenue. The house of representatives, or lower house, consists of 80 members (four of them Maoris elected by Maoris), who are elected for three years. Members of both houses are paid. There are two parties, Labour and National. A Labour govt. was in office 1935-49.

**SOCIAL LEGISLATION.** N.Z. established a Public Trust office in 1872, and three years earlier a government annuities and life

settlement; Advances to Settlers Act; state fire and accident insurance, state control of water power, and state maternity homes. The Labour govt. has introduced new measures of state control and revised old ones. The state owns and runs rlys. and air lines, and some of the coal mines, forests, sawmills, and tourist resorts. The state-owned Reserve Bank gives effect to the financial policies of the govt. The Social Security Act 1938 provided health insurance and coordinated and improved existing pensions legislation. The social security system was still further advanced in 1945. The money for the system is found by a tax (in 1947, 1s. 6d. in the £) on all wages, salaries, and other incomes, including company income.

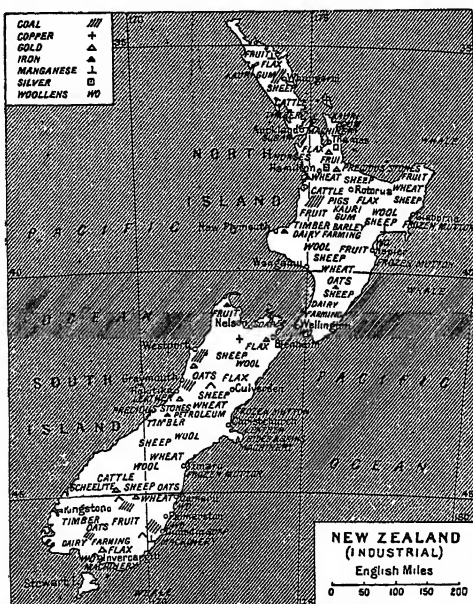

**HISTORY.** New Zealand was discovered by Tasman in 1642; he named Cape Maria van Diemen after the wife of the governor of the Indies. The next European visitor was Capt. Cook, who came in 1769, 1773, and 1777. British, French, and Spanish ships arrived during the next 20 years. In 1815 the first mission was established in the bay of Islands. The first attempt at colonisation was made in 1825, but failed. In 1840 Wellington was founded, and Capt. Hobson proclaimed the

the war by New Zealand troops. Later, New Zealanders helped to defend the Suez canal. A force went to Gallipoli, April, 1915, and with the Australians—the combined force known as the Anzacs—took part in the landing at Anzac Cove and subsequent operations.

In the Second Great War, New Zealand declared war against Germany a few minutes after the U.K. She sent some 135,000 men overseas, and they suffered over 30,000 casualties (10,000 killed, 19,000 wounded, besides missing). The New Zealand armoured div. did magnificent service in N. Africa and in Italy (see Italy: Campaign in, 1943-45; North Africa Campaign).

**EDUCATION.** The first schools were mission schools, and the first pupils Maoris. Until 1876 education was a provincial concern and most schools were denominational. The Education Act of 1877 provided that education should be free, secular, and compulsory, the simplest form of bible reading being banned as purely Protestant. At three a child may enter a free kindergarten. At five he (or she) may become a pupil at a coeducational state primary school in which there are free dental service, free milk daily, and apples in season. Attendance at school is compulsory between seven and 15. Thereafter the pupil may go to a secondary school and then to the university. The university of N.Z. consists of Otago university at Dunedin and university colleges at Auckland, Wellington, and Christchurch. There are a few private fee-charging schools where religious instruction may be provided. The tendency of many of N.Z.'s best children to go overseas and stay there, even when suitable vacancies are available in N.Z. causes some concern.

**THE PRESS AND LETTERS.** When the Labour govt. came to power in 1935 there were more than 40 daily papers, of which only one supported the govt. A new Labour daily, The Southern Cross, was published in Wellington in 1946. The New Zealand Herald, Auckland, has still the largest circulation of N.Z. papers. The Auckland Star, a lively evening paper, the Wellington Dominion, the Wellington Post, the Christchurch Press, and the Otago Daily Times also have large and influential circulations. Of the weekly press, the Auckland Weekly News and the Freeman have position and prestige. The Listener is an ex-

New Zealand. Map showing the distribution of resources and products throughout the Dominion

insurance office. The use of the govt. telephone is almost universal. Hospitals are government institutions. Labour legislation began with the Employment of Females Act of 1873, which established an 8-hr. day for women. Since 1891 all factory labour has been controlled, sweated labour abolished, and minimum wages determined. In addition a system of industrial conciliation and arbitration has been developed.

Richard Seddon, prime minister 1893-1906, introduced old age pensions (1898); superannuation for police, rly. servants, teachers; compulsory purchase of land for

sovereignty of Queen Victoria. Other settlements, Auckland, Nelson, etc., followed during the next decade.

The most important subsequent events were the Maori Wars, 1860-70, the discovery of gold in 1867, the adoption of refrigeration, and the part played by New Zealand in the two Great Wars.

During the First Great War the Dominion furnished 91,914 volunteer troops and 32,270 conscript troops. In Aug., 1914, a New Zealand force, acting in conjunction with British and Australian warships, seized German Samoa, which was garrisoned throughout

cellent broadcasting paper; the National Review combines both finance and culture.

Katherine Mansfield is the most distinguished of N.Z.'s writers, and N.Z. is the scene of her best stories. She is the interpreter of that transitional period in the life of Wellington when it developed from a small town to a big city. William Pember Reeves combined official duties in London with authorship. His best known work, *The Long White Cloud*, is one of the most charming and authoritative historical works in Empire literature. Jessie Mackay, strong supporter of women's rights, was a poetess of merit. Opportunities for publication are, however, rather limited, and so, as in so many other walks of life, the best writers have exercised their craft overseas.

Despite the fact that N.Z. landscapes are unsurpassed, there is no distinctive school of painting. The best known artist N.Z. has produced is David Low, the cartoonist. In music N.Z. has produced such able performers as Rosina Buckman and Oscar Natzka, singers, Colin Horsley, pianist, Douglas Lilburn, composer, and Warwick Braithwaite, conductor. A national symphony orchestra was formed in 1946.

**THE MAORIS.** The Maoris, who originally came from Polynesia, were in N.Z. hundreds of years before the whites arrived. They were fighters and cannibals with the reputation of being the wildest and most intractable race known. This reputation was a prime factor in deterring whites from visiting N.Z. Cook set an example by his (judged by the standards of the times) humane treatment of the Maoris. But many whalers and other trading adventurers were not so enlightened. It gradually came to be recognized that the Maoris were quick to react to the treatment they received. If consideration was shown them, they were appreciative, peaceful, and tractable. If they were treated harshly, they exacted a terrible revenge, slaying and eating their oppressors.

By the treaty of Waitangi, Feb. 6, 1840, the chiefs of N.Z. ceded to Queen Victoria all their rights and powers of sovereignty and in return were promised undisturbed possession of their lands and other property. The treaty, noble in conception, proved unworkable, in view of white immigration, and led to much hostility between the two peoples, culminating in the war of 1860-70.

New Zealand Flax. Left, sword-shaped leaves; right, flower-head with tubular blooms

The man most responsible for the present good relations between Maoris and whites was Sir George Grey, who was governor in 1846 and again in 1861-70, and from 1877 to 1884 premier of N.Z. He laboured to advance the status of the Maoris and to strengthen friendly relations between them and the whites, and laid the foundations of the mutual respect which the two peoples acquired for each other.

**New Zealand, BANK OF.** Institution established by Act of the N.Z. parliament in 1861. Nearly all the capital stock is held by the government, to which the institution acts as banker. There are over 250 branches in New Zealand, Australia, and the Pacific islands. The head office is at Wellington, and the London office at 1, Queen Victoria St., E.C.4.

**New Zealand, UNIVERSITY OF.** State university of the dominion. An examining body only, it was founded in 1870. It consists of the university of Otago at Dunedin; Canterbury College at Christchurch; Auckland university col-

lege; and Victoria university college at Wellington, where are the headquarters. For agricultural students there are Lincoln College at Canterbury, and Massey Agricultural College at Palmerston North. The agent is addressed c/o High Commissioner for New Zealand, 415, Strand, London, W.C.2.

**New Zealand Flax** (*Phormium tenax*). Perennial herb of the family Liliaceae, native of New Zealand. The sword-shaped leathery leaves are 3 to 6 ft. in length, arranged in two ranks, the older leaves clasping the younger at their base. When old they split at the tip. The flower-stem is about 15 ft. high, branched above, the branches supporting the curved, tubular, red or yellow flowers. The leaves yield beautiful and strong fibres, which Capt. Cook found served the natives for a variety of purposes—clothing, nets, twine, etc.—but the presence of gum in the leaves, difficult to remove, has made preparation for export much too costly.

**New Zealand Spinach** OR **NEW ZEALAND ICE-PLANT** (*Tetragonia expansa*). Fleshy herb of the

New Zealand Spinach. Branches with foliage and flowers

family Aizoaceae. It is widely distributed in the S. hemisphere. It is more or less prostrate, with alternate oval, fleshy leaves, and inconspicuous, imperfect yellow flowers. It is frequently grown in Europe as a substitute for real spinach (*Spinacia oleracea*).

**Next Friend.** In English law, adult person who lends his name to a legal proceeding brought by or on behalf of an infant or lunatic. The action is entitled "A. B. (an infant) by C. D. his next friend." The next friend need not be any relation of the infant; and before his name can be used, he must sign a consent for that purpose. If the infant plaintiff loses with costs, the next friend is liable to

Niagara Falls. The world-famous sight on the Niagara river, N. America, seen from the Canadian side. On the left is the American Fall, on the north side of the river, to the right the Horseshoe, or Canadian Fall, on the south side. Dividing the two is the thickly wooded Goat Island, a New York State park

the defendant for these costs, though as a rule these are allowed him out of the infant's estate. See Insanity.

**Ney, MICHEL** (1769-1815). A French soldier. Born Jan. 10, 1769, at Saarlouis, he was the son of a cooper.

Joining the army in the ranks in 1788, he rose rapidly during the Revolutionary wars, and by 1796 had become a brigadier-general. The capture of Mannheim in 1799 added to his reputation,

and in 1804 he was created a marshal, having fought at Hohenlinden and other battles against the Austrians, and conducted a diplomatic mission to Switzerland. His storming of the entrenchments at Elchingen in 1805 brought a dukedom, and he distinguished himself at Jena, Eylau, and Friedland.

Sent to Spain in 1808, Ney returned from the Peninsula in 1812, having quarrelled with Masséna, under whom he had been called upon to serve in the invasion of Portugal. His victory at Borodino in the Russian campaign in

1812 brought him the title of prince of Moskova, and to him is due the credit of saving the remnants of the French army in the retreat. In 1813 he fought at Lützen, Bautzen, and Leipzig, but he made his peace with the Bourbon regime in 1814. When Napoleon returned from Elba, Ney was sent to oppose him, but he deserted with his army to his old master, fought a drawn battle with Wellington at Quatre Bras, and two days later, as one of Napoleon's favourites, commanded the centre at Waterloo. For his desertion he was sentenced to death and shot in Paris, Dec. 7, 1815; but it is hard to regard him as a traitor. There are studies by L. Blythe and P. Compton, both 1937.

**Ngami.** Lake in the N.W. of the Bechuanaland Protectorate. It was discovered by Livingstone in 1849. During recent years it seems to have been drying up, and the Okovango river which formerly discharged into it no longer does so. It has been proposed to divert rivers into the lake so as to make it into a reservoir for irrigation purposes.

**Niagara.** Town and tourist resort of Ontario, Canada. It stands on the Canadian side of the Niagara river, where it falls into Lake Ontario. It is 15 m. below the Falls, and is sometimes called Niagara-on-the-Lake. Known as

Newark, it was burned down by U.S. troops, Dec. 10, 1813, and was the first capital of Upper Canada, now Ontario. Pop. 1,541.

On the opposite (U.S.A.) side of the river is Fort Niagara. Here Hennepin and Lamott landed, Dec. 6, 1678. The French maintained a fort until it was taken by the British under Sir W. Johnson in 1759. It was an important point during the War of Independence, as it was in the war of 1812-14, by which time it had become the property of the U.S.A. On Dec. 29, 1813, a British force took it, but it was restored to the Americans. The magazine and other old buildings remain.

**Niagara Falls.** Famous falls on the lower portion of the Niagara river, N. America. The river, which is 33 m. long, separates in part the prov. of Ontario, Canada, from the state of New York, U.S.A., and flows from Lake Erie to Lake Ontario. During its course it makes a total descent of about 326 ft., 50 ft. being in the rapids above, and 111 ft. in those below, the Falls. The river is interspersed with islands, Grand Island being about 27 sq. m. in area. About 4 m. lower down the river is precipitated over a great limestone ledge.

The cataract is divided into two by Goat Island, the American Fall, on the N. side, being some

1,080 ft. wide and 167 ft. high, and the Horseshoe or Canadian Fall, on the S. side, 2,600 ft. across and 158 ft. high. The depth of water at the crest of the former is 10 ft., and of the latter 20 ft. The volume of water sweeping over both cataracts is computed at 100,000,000 cu. ft. per hour. The spectacle is illuminated by huge lamps. Below the descent the river plunges through a deep and narrow chasm to Lewiston, 7 m. distant. The walls of this ravine lie from 200 to 400 yds. apart, and rise sheer to a height of from 80 to 100 yds. About 2 m. below the Falls is the whirlpool.

The river is crossed by three bridges below the Falls, a suspen-

Niagara Falls park (1888) covering 154 acres, and the New York State park (1885) 115 acres. See Blondin.

**Niagara Falls.** City and port of entry of Ontario, Canada. It stands on the W. side of Niagara river, here crossed by three bridges about 2 m. below the Falls, being 82 m. from Toronto. On the opposite side of the river is the American city of Niagara Falls. The Canadian place is served by C.P.R., Michigan Central, New York Central and other rlys., while an electric rly. connects it with Toronto. Its enormous water power, generating electricity under the Ontario hydro-electric power commission's Queenston-Chippawa development, yields 525,000 h.p. which is employed for the factories here and for those of Toronto and other cities. A park, commemorating Queen Victoria, occupies a length of 2 m. along the river. The original name of the place was Clifton. It then became Drummondville, but was known as Niagara Falls when made a city in 1903. Pop. 20,589.

**Niagara Falls.** City and port of entry of New York state, U.S.A. It is in the co. of Niagara, on the river of that name, and extends for 7 m. above the celebrated falls. With Buffalo, 23 m. to S.E., it is connected by rly. It is the seat of a university, thrives on tourist traffic, and provides employment in hydro-electric projects, foundries, and the making of abrasives, paper, and cereal foods. The civic charter dates from 1892. Pop. 78,029.

**Niagara Series.** Subdivision of the Silurian system of rocks found in Canada and the U.S.A. The Niagara limestone forms the sill, slowly eroded through centuries, over which the great waterfall plunges. The series overlies the Clinton iron-bearing series which occurs in the Appalachians.

**Niamey.** Town of French W. Africa. The capital of the colony of the Niger, it is situated on the E. bank of the Niger river, 150 m. above the point where it enters Nigeria. Niamey trades in ivory and is a terminus of the trans-Saharan motor route. Pop. 5,000.

**Niam-Niam** (Great eaters). Dinka name for a negroid people on the watershed between the tributaries of the Bahr-el-Ghazal and the Welle basin, in Central Africa. They call themselves Zandé. Agile, round-headed, thick-lipped, chocolate-hued, they exhibit aboriginal Nuba elements

with Fula admixture. They are warriors and skilful iron-workers. See Negro.

**Nias.** An island of Indonesia. It is in the Malay Archipelago, off the W. coast of Sumatra. Its soil is extremely fertile, its inhabitants Malays akin to the Battas. Rice is the main product. Area, 1,800 sq. m.

**Nibelungenlied** (Ger., song of the Nibelungs). Medieval German epic. The unknown Austrian author composed the poem c. 1200 or earlier. The stanza consists of three lines with six accents and one with seven, and the poem, in 38 adventures, has two parts. The first part relates the story of Siegfried, his marriage to Kriemhild, her jealousy of Brunhild, and the murder of Siegfried by Hagen, the Nibelung; and the second part tells how Kriemhild, who had married Etzel or Attila, king of the Huns, avenges herself on the Nibelungs and is herself slain. The name Nibelungs, originally a perhaps mythical pygmy people, whose hoard Siegfried had won, is, in the *Nibelungenlied*, transferred to the Burgundian house ruling at Worms, who acquire the hoard through the murder of Siegfried. Their king, Gunther, brother of Kriemhild and husband of Brunhild, is the historic Gundahari, who was slain when the Burgundian kingdom of Worms was destroyed in 437.

The Icelandic *Völsunga Saga* and other versions preserve more primitive forms of the Siegfried legend than the *Nibelungenlied*, which eliminates many crude and mythological elements, and deepens the tragic motives. Its courtly and chivalric setting only slightly obscures the manners and ideas of an earlier pagan age. Of the many renderings of the *Nibelungenlied* into modern German, that of Simrock may be mentioned, and of English translations those by A. G. Foster-Barham, 1887, A. Horton, 1898, and in prose by M. Armour, 1897. Wagner's operatic cycle, *The Ring*, is based on the epic. See Brunhild; Siegfried; Wagner. *Pron.* Neebeloongenleed.

**Nicaea** (mod. Iznik). Ancient city of Bithynia, Asia Minor. The name was given by Lysimachus in honour of his wife to a city founded by Antigonus. The kings of Bithynia made it one of their two residences. It is celebrated as the scene of the general Church council 325 (v.i.). Nicaea long remained an important city; it was the capital of the Seljuk

Niagara Falls. Plan showing the position of the Falls and the adjacent Canadian and American shores

sion bridge for pedestrians and carriages a little distance below the cataract, and two railway bridges about 2 m. farther down. A cable car carries passengers immediately over the whirlpool. Since 1890 the water power has generated electricity, the water being drawn off through tunnels above the Falls and returned in a similar manner into the chasm below. The amount diverted for this purpose is limited to 36,000 cusecs on the Canadian side and 20,000 cusecs on the American. The shores along both sides of the Falls have been made government reservations, the Queen Victoria

sultan Soliman in 1078, and the seat of an Eastern empire after the conquest of Constantinople by the Latins in 1204.

**Nicaea, COUNCIL OF.** General council of the Church. It met June 19, 325, being convened by Constantine to settle the Arian controversy, determine the correct date for the observance of Easter, and consider other questions. Arius attended to defend his teaching, while the orthodox party was championed by Athanasius. The council formulated the nucleus of the Nicene Creed (*q.v.*). The teaching of Arius was condemned, and 14 of his 17 supporters submitted. It was settled that Easter should be a Sunday. Arius was banished to Illyria by Constantine, and his adherents exiled. *See* Arianism; Athanasius; Easter.

**Nicaragua.** Central American republic. It lies between the Pacific Ocean and the Caribbean Sea and between

Nicaragua arms

Costa Rica on the S. and Salvador and Honduras on the N. The E. coast, of which the N. section is known as the Mosquito Coast, is backed by an alluvial plain, beyond which lie the central mts., which rise to 7,000 ft. The E. is peopled by Indians and negroes from the West Indies, the W. by Spaniards, Indians, and people of mixed Spanish and Indian origin. The E. produces bananas, coconuts, and pineapples, the W. coffee, sugar-cane, cocoa. Area 57,143 sq. m. Pop. 1,389,000.

Extensive forests yield mahogany, cedar, gums, and medicinal plants. Over a million cattle provide hides for export. Gold and silver are mined; copper, tin, and zinc are known to occur. Managua is the capital; the W. ports Corinto and San Juan del Sur do more than two-thirds of the trade; the E. ports Bluefields, Pearl Lagoon, and Greytown (San Juan del Norte) are mainly interested in the fruit trade with U.S.A. The rly. runs inland from Corinto.

Nicaragua was peopled by the Aztecs, who have left here traces of their civilization. In 1522 the Spaniards landed and founded Granada, after which for nearly 300 years the country was under Spanish rule as a province of Guatemala. In 1821 it became an independent republic, and at the same time a series of wars began. These were with Costa Rica, Guatemala, and even Great Britain, which

claimed a protectorate over the Mosquito Coast, given up in 1860.

In the 20th century the U.S.A., taking an increasing interest in the affairs of the republic, found it advisable to intervene. Detachments of troops were sent to maintain the president, Adolfo Diaz, in power against his rivals. In 1927 peace was made between the contending factions, and a local constabulary under American officers was founded, but this did not prevent desultory fighting between U.S. marines and the nationalists. In 1931 Managua was devastated by an earthquake.

Nicaragua drew up a new constitution on March 22, 1939, providing for a congress with two houses; a chamber of deputies (one for each 30,000 inhabitants) of 40 members and a senate of 15, elected by popular vote for 6 years, as also is the president. The prevailing religion is R.C. Teaching of English in the schools is compulsory. In 1941 a university was established at Managua. Aviation is being developed, and there are several commercial and military airports. Roughly a third of the country grows timber, but gold and coffee are the main exports. *See* Central America. *Consult* An Economic and Financial Survey, W. W. Cumberland, 1928; Through Unknown Nicaragua, M. G. Palmer, 1946.

**Nicaragua.** Lake of Central America. It lies in the S.W. of Nicaragua, its S. end bordering on Costa Rica, and is separated from the Pacific by a narrow isthmus. Oval in outline, it measures 110 m. by 45 m. and has an area of about 2,990 sq. m. The depth varies between 15 ft. and 250 ft. It receives the surplus waters of Lake Managua at its N. end, and

discharges its own through the San Juan into the Caribbean Sea.

Surveys have proved that it was once continuous with Lake Managua and discharged into the Pacific. It contains islands, the largest of which is Zapatera. Sculptured stones, massive idols, and other antiquities have been discovered on its shores. Water fowl and alligators abound. Granada (*q.v.*) at the N.W. corner is the principal town on the lake.

**Nicaragua Canal.** Proposed ship canal between the Caribbean Sea and the Pacific Ocean through L. Nicaragua. In 1849 an American company obtained a concession from the Nicaraguan government; but no work was done, and the project remained in abeyance after the construction of the Panama Canal (*q.v.*).

**Nicarao** OR NIKUITAN. American Indian tribe which had reached a stage of advanced culture in Central America at the time of the Spanish conquest. Of Aztec speech, they established tribal communities between Lake Nicaragua and the Pacific coast, as well as on the lake islands. Remoter offshoots reached the Nicoya peninsula and the W. end of the Chiriqui lagoon. They introduced human sacrifices and certain forms of Mexican culture into Nicaragua and are reputed to have kept registers of property.

**Nice.** French city and pleasure resort, capital of the dept. of Alpes-Maritimes. It stands on the Baie des Anges, an opening of the Mediterranean, at the mouth of the Paillon. It is 740 m. by rly. S.E. of Paris, and is noted for its warm climate (mean temp. 60°).

It consists of a small medieval town, with ruins of a castle on the hill, a cathedral (1560), the church

Nice, France. A view across the old town and port to Mont Boron. In the foreground is one of the three main roads leading to Monte Carlo

of S. Jacques (16th century), and other old buildings, and a modern city, most of it built in the 19th century. Its main thoroughfare is the Promenade des Anglais, along the coast, which contains luxurious hotels and shops. Just off it is a remarkable memorial to the victims of the First Great War, carved out of the solid rock. The city has an airport, an observatory, museums, and libraries. There are some industries, such as the manufacture of chocolates and perfumes, but the tourist traffic is the chief source of the city's prosperity. It was founded about 300 B.C. as a satellite town of Marseilles, about 100 m. away, and has been since A.D. 300 the seat of a bishopric. It fell to Savoy in 1388, and in 1543 was pillaged by Frederick Barbarossa who carried off 2,500 captives. It changed hands a number of times before in 1860 it was ceded to France by Sardinia. Its recovery for Italy was one of the aims of Mussolini. After the Franco-Italian armistice of June, 1940, it lay in the demilitarised zone beyond the Italian zone of occupation. The Italians occupied it in Nov., 1942, German troops taking over from them Aug., 1943. It was liberated by the U.S. 7th army, Aug. 30, 1944, little damaged except in the harbour area. Pop 211,165.

**Nicene Creed.** Statement of faith drawn up, 325, at the council of Nicaea, (q.v.). It was formerly maintained that the creed of Nicaea was based upon that of Caesarea, but it is rather a compendium of the baptismal creeds of Caesarea, Alexandria, Jerusalem, and Antioch. At subsequent councils additional phrases were added to the Nicene Creed (originally anti-Arian) in order to check other heresies, e.g. at Constantinople, 381, to refute the teaching of Apollinarius, Macedonius, and Marcellus; at Ephesus, 431, and Chalcedon, 451, against Nestorianism and Eutyches. Still later additions were made at the councils of Toledo, 447 and 589, and at Gentilly, 767, when the *filioque* clause was added, concerning the procession of the Holy Spirit from the Father and the Son, a claim not finally adopted in the Roman version of the Nicene Creed until 1014. This was and remains one of the

matters in dispute between the Western and Orthodox Churches. The use of the Nicene Creed has been confined to the Mass or Holy Communion in both Churches. As revised at Chalcedon, it is the definitive creed of Christendom. See Christianity; Church; Creed. Consult Chalcedon, J. S. MacArthur, 1931; History of the Creeds, F. J. Badcock, 1938.

**Nicephorus.** Name of three East Roman emperors. The first seized the throne from the empress Irene in 802, and was slain during an invasion of Bulgaria in 811. The second who had been an army commander, reigned from 963 until as the result of a conspiracy by his wife and nephew he was assassinated in 969.

Nicephorus III was emperor 1078-81. General of the army of the East under Michael VII, on the latter's resignation he was proclaimed emperor by the troops at Nicaea and crowned in Constantinople, April 3, 1078. During his reign the Seljuk Turks gained possession of Asia Minor except the coasts, and lower Italy fell into the hands of the Normans. His general, Alexius Comnenus (q.v.) who had hitherto loyally supported him, raised the standard of revolt, and deposed Nicephorus who retired to a monastery. He was the last emperor of the Armenian or Macedonian dynasty, which had lasted from 867. See Byzantine Empire. Pron. Niseeforus.

**Nicholas OR NICOLAS** (d. c. 342). Bishop and saint. A native of Patara, in Lycia, Asia Minor, he became archbishop of Myra, and opposed the Arians at the council of Nicaea. Buried in his cathedral at Myra, his supposed remains were re-interred May 9, 1087, in the church of San Nicola, Bari, Italy, where they are visited annually by thousands of pilgrims. He is the patron saint of Russia and of seafarers, travellers, merchants, children, and those overtaken by sudden danger. The popular name Santa Claus is a corruption of S. Nicholas. His festival is kept on Dec. 6. In addition to the cathedral at Newcastle and a chapel in York Minster, more than 370 English churches are dedicated to him and he is the subject of notable works by Titian, Lorenzo Lotto, Raphael, and other artists, and of innumerable legends.

**Nicholas.** Name of five popes. Nicholas I, pope 858-67, largely developed the papal power, excommunicating Photius, the intruded patriarch of Constantinople, and various Frankish arch-

bishops who disputed the papal supremacy. Nicholas II, pope 1058-61, was the nominee of Hildebrand. The anti-pope Benedict X was deposed in his favour, and his chief work was to free the papal elections from the Roman factions and the control of the emperor. His name was Gerhard of Burgundy. Nicholas III belonged to the Roman Orsini family and was pope 1277-80. His policy was to strengthen the papacy by checking the imperial influence in Italy. He made the Vatican the official papal residence. Nicholas IV, who reigned 1288-92, was of humble family and the first Franciscan pope. His financial measures gave the college of cardinals independence.

**Nicholas V** (1397-1455). Pope 1447-55. Tommaso Parentucelli, a native of Liguria, was educated at Bologna and became its bishop in 1443. He was created cardinal in 1446, and elected pope the following year. His pontificate was notable for the architectural improvements carried out in Rome: the building of churches, the paving of streets, the provision of an adequate water supply by means of the ancient aqueducts on which Rome had once depended; the rebuilding of the Vatican and the basilica of S. Peter, and the foundation of the Vatican library, which Nicholas also enriched with many treasures. For Frederick III, 1452, he performed the last imperial coronation in Rome. Nicholas died March 24-25, 1455.

**Nicholas I** (1796-1855). Tsar of Russia. Born at Tsarkoe-Selo (now Pushkin), July 6, 1796, third

Nicholas I,  
Tsar of Russia

son of Paul I and Maria Feodorovna of Württemberg, he received a careful education under his mother's supervision, and in 1814-15 visited several European countries. On his return to Russia, July 13, 1817, he married Charlotte, eldest daughter of Frederick William III of Prussia. His elder brother Constantine renouncing his claim to the throne, Nicholas succeeded his eldest brother Alexander I, Dec. 1, 1825, and was formally crowned at Moscow, Sept. 3, 1826.

His accession was the occasion of a mutiny among Constantine's adherents in the army, in dealing with which he displayed great

personal courage and firmness. His foreign policy was directed towards the East, particularly the conquest of Turkey, which power he described as "the sick man of Europe." The war with Persia, concluded Feb. 28, 1828, much increased Russia's foreign territory. Nicholas died March 2, 1855, six months before the fall of Sevastopol in the Crimean War.

**Nicholas II** (1868–1918). Tsar of Russia. Eldest son of Alexander III, he was born at Tsarskoe-Selo, May 18, 1868, and educated in modern languages and science by Gen. Danilovitch, director of St. Petersburg academy. He travelled in the Far East during 1890–91, and narrowly escaped assassination in Japan. He succeeded to the throne, Nov. 1, 1894, and married princess Alix of Hesse, Nov. 26; the latter took the name of Alexandra (q.v.). Nicholas was crowned at Moscow in May, 1896.

At the beginning of his reign liberal influences gained great strength, and dissatisfaction with the government's policy was widespread. Kindly, desiring peace, and believing in the divine right of kings, Nicholas was unfitted for the task of his high office. Though convinced of his exalted mission, he allowed constitutional reforms, only to nullify them by subsequent actions. The empress's influence increased his fatalistic tendencies; he showed neither the courage to maintain autocratic rule, nor the resolution to adapt himself to the liberal movements of his time. The First Great War exposed the internal weakness of the régime, and the baleful influence of Rasputin hastened the final collapse. Nicholas signed on demand and without protest the decree of his abdication March 15, 1917. He retired to the Crimea, but was later arrested, transferred to Tsarskoe-Selo, and thence to Tobolsk where he was interned with his wife, son, and four daughters. The imperial family was then transferred to Ekaterinburg (Sverdlovsk) in the Urals, and with Kolchak's advance their fate was decided on by the Soviet leaders in Moscow. But the Communists of Ekaterinburg were determined to put the tsar and his family to death, and the commissar Yourkovsky was responsible for carrying out the assassination, July

Nicholas II,  
Tsar of Russia

16, 1918. The corpses were removed to an isolated spot in the neighbourhood of Ekaterinburg, and burnt. The tsar's correspondence with his wife appeared in English in 1929. Consult The Emperor Nicholas II, Sir J. Hanbury Williams, 1922; Nicholas II, C. Radziwill, 1931.

**Nicholas** (1841–1921). King of Montenegro. He was born Sept. 25, 1841, and educated mainly in Paris. In Aug., 1860, he succeeded his murdered uncle Danilo as prince of Montenegro and he was still reigning when the Great War broke out in 1914. The independence of his country was recognized in 1878, and in 1910 he took the title of king. In 1916, having joined in the First Great War on the side of Serbia, he was driven out and took refuge in France. He resigned his rights to Montenegro, and died at Antibes, March 1, 1921. See Montenegro.

**Nicholas Nickleby**. Charles Dickens's second novel, published in monthly parts, April, 1838–Oct., 1839, with illustrations by Phiz. Designed first to expose the "monstrous neglect" of education and the crying evils of the cheap boarding-schools for boys at that time still common in the N. of England, the book contains some of Dickens's best known creations, including Wackford Squeers, master of Dotheboys Hall; the Cheeryble Brothers, benefactors of Nicholas; Vincent Crummles, the itinerant theatrical manager, and his family, and Mr. and Mrs. Mantalini. The novel was dramatised by E. Stirling, 1838 (before the monthly parts were completed, and much to Dickens's anger), and A. Halliday, 1875. A film version was shown in 1947.

**Nichols, (JOHN) BEVERLEY** (b. 1898). British writer and critic. Born Sept. 9, 1898, he was educated at Marlborough, and Balliol, Oxford. His first novel, *Prelude*, appeared in 1920, and he became a best-seller with *Crazy Pavements*, 1927, and *Evensong* (later dramatised in collaboration with E. Knoblock), 1932. Other popular successes included *Twenty-Five* (autobiography), 1926; *The Star-Spangled Manner* (U.S.A. impressions), 1928; *Down the Garden Path* (gardening essays), 1932; *The Fool Hath Said* (religious essays), 1936; *Men Do Not Weep*, 1941; *Verdict on India*, 1944. *Cry Havoc*, 1933, was an emphatic statement of pacifism, but after the emergence of Hitler he changed his views. He wrote the book and composed the music (with V.

Ellis) of Cochran's *Revue*, 1930. His other plays include *Avalanche*, 1931, and *Floodlight*, 1937.

**Nichols, JOHN BOWYER** (1779–1863). British printer and antiquary. He was born in London, July 15, 1779, and educated at St. Paul's School, in 1796 entering his father's printing business. Long associated with *The Gentleman's Magazine*, he was its proprietor, 1834–56. He was one of the printers to Parliament. His chief work was the publication of county histories. Fellow of the Linnean Society, 1812, and of the Society of Antiquaries, 1818, he died at Ealing, Oct. 19, 1863.

**Nichols, ROBERT MALISE BOWYER** (1893–1944). British poet. Born Sept. 6, 1893, he was educated at Winchester, and Trinity College, Oxford. He made his reputation as a lyric poet during the First Great War when his first collection of poems *Invocation* appeared in 1915. Other volumes included *Ardours and Endurances*, 1917; *Aurelia*, 1920; *Fisbo*, 1934; *Such was my Singing*, 1942. He also wrote plays, including *Guilty Souls*, 1922; *Wings over Europe* (with Maurice Browne), 1929. Nichols, who had been professor of English literature at Tokyo university, 1921–24, died Dec. 17, 1944.

**Nicholson, JOHN** (1821–57). A British soldier and administrator. Born in Ireland, Dec. 11, 1821, he was educated at Dungannon. He entered the service of the E. India Co. in 1839, and in 1841 was taken prisoner by the Afghans, but he soon escaped, and in 1845–46

John Nicholson,  
British soldier

he served against the Sikhs, as he did when the war broke out again in 1848. Appointed a deputy commissioner in the Punjab after its annexation, Nicholson proved himself an administrator of extraordinary gifts, exerting such a marked influence over the natives that he was worshipped by a brotherhood of fakirs.

When the mutiny broke out in 1857, he checked the movement in his own district, and then took command of a mobile column and advanced to Delhi. Marching at a tremendous pace, he destroyed on the way a body of rebels near Gurdaspur, and then reached the besieged city. On Sept. 14, when leading the storming party, he was mortally wounded, and he died

Sept. 23, 1857. In the Punjab his fearlessness and justice were a constant source of wonder, and the impression he made on his contemporaries was summed up by Lord Roberts, who said that Nicholson impressed him more powerfully than any man he had ever met. *See Indian Mutiny; consult also Life*, L. J. Trotter, 1904.

**Nicholson**, SIR WILLIAM (NEWZAM PRIOR) (1872-1949). British artist. Born at Newark-on-Trent,

he was educated there, and first became known to the general public by his illustrations to *An Alphabet*, and *An Almanac of Twelve Sports* (with Rudyard Kipling), 1898, and London types (with W. E. Henley), 1898. The posters he designed in collaboration with his brother-in-law James Pryde (the "Beggarsstaff Brothers") were the first to draw attention to the artistic possibilities of the new medium. His later reputation was based chiefly on his ability as a portrait-painter, the best known examples of which included W. E. Henley, Gertrude Jekyll (both in the Tate Gallery), George Saintsbury, Walter Greaves, Ursula Lutyens, Lord Horder, and Marie Tempest. He also painted landscapes and still-lives; of the latter the best known is probably *The Hundred Jugs* (Liverpool Art Gallery). He was knighted in 1936, and his publications included *Characters of Romance*, 1900; *Clever Bill*, 1926; *A Book of Blokes*, 1930. He died May 16, 1949. *Consult Life*, M. Steen, 1943.

His son Ben Nicholson (b. 1894), educated at Tours, Milan, and Pasadena, U.S.A., became a leading member of the Constructivist group of painters. An abstractionist, he was concerned primarily with planes and surfaces. He held one-man exhibitions at the leading London galleries.

**Nicias** (d. 413 B.C.). Athenian statesman and general during the Peloponnesian War. In opposition to the democratic party, he strongly advocated bringing the war to an end while favourable peace terms could be obtained, and took a leading part in negotiating the short-lived peace of 421 B.C. Having already achieved several military successes, he was chosen chief commander of the expedition to Sicily in 415 B.C., though personally

opposed to it. At first he met with some success, but the arrival of the Spartan Gylippus changed the situation, and though reinforced by Demosthenes, Nicias was defeated both by sea and by land. The Athenian force surrendered, and Nicias and Demosthenes were put to death. *See Peloponnesian War; Syracuse*.

**Nickar Nut** (*Caesalpinia bonduc* and *C. bonducella*). Seed of evergreen shrubs of the family Leguminosae. Natives of tropical sea shores, they are trailing plants with the leaves twice divided into small leaflets. The rusty yellow flowers form sprays, and are followed by prickly pods containing one to three large hard and polished seeds, which have a very bitter taste. In native Indian medical practice they are used as a tonic and fever cure, while the oil compressed from them is used in palsy. They are also strung together as necklaces and rosaries.

**Nickel**. One of the metallic elements. The name originated in Germany, where nickel is present in small amounts in the copper of the Harz mts. Finding the ore would not produce readily-worked copper, early miners named it *Kupfernickel*, Nicholas (or Old Nick) copper. The metal was isolated by Cronstedt in 1751. The element, chemical symbol Ni, is in the transitional group of the first long period of the periodic table, next to cobalt, iron, manganese, and chromium, while copper is its neighbour on the other side. It has an atomic number, 28; atomic weight, 58.69; melting point, 1,455° C.; boiling point, 2,340° C.; specific gravity, 8.90; electrical conductivity, 24 (silver being 100); crystal forms (a) alpha-nickel, close-packed hexagonal, with lattice constants,  $a=2.49$  and  $c=4.08$  and an interatomic distance of 2.49 Ångström units; and (b) beta-nickel, face-centred cubic, with lattice constant  $a=3.517$  and an interatomic distance of 2.486 Ångströms.

The most important ore mineral of nickel is pentlandite, a nickel-iron sulphide. Less important are millerite, nickel sulphide; niccolite, nickel arsenide; and garnierite, a hydrated nickeliferous magnesium silicate. More than 80 p.c. of the world's nickel is produced in the Sudbury dist. of Ont., Canada, where pentlandite, (FeNi)S, occurs with pyrrhotite,  $\text{Fe}_9\text{S}_{11}$ , and chalcopyrite,  $\text{CuFeS}_2$ ; the average ore runs 3 p.c. nickel and 2 p.c. copper. This area also produces platinum

as a by-product. The ore-bodies at Sudbury are found near the bottom of a sheet of norite, a basic igneous rock, which has been intruded to form a large elliptical basin. Smaller nickeliferous sulphide deposits similarly associated with basic igneous rocks occur also near Petsamo in the U.S.S.R. and in Norway.

Garnierite, (NiMg)  $\text{O.SiO}_2 \cdot x\text{H}_2\text{O}$ , occurs very sporadically as small veins and pockets in weathered serpentine rocks in the French colony of New Caledonia. Before 1905, the world's chief source of nickel, these deposits supplied only some 6 p.c. of the total after production began in the Sudbury dist. Other producers of nickel are Greece, Burma, the U.S.A., French Morocco, and Brazil.

In Canada, the ore, after crushing, is concentrated by selective flotation, giving a copper concentrate containing over 50 p.c. of the copper and very little nickel, and a nickel concentrate containing nearly all the nickel and the rest of the copper, with iron and sulphur. After thickening, the nickel concentrate, which is about 4 p.c. nickel, is partially roasted in mechanical roasters, some of the sulphur being left, and is then smelted in reverberatory furnaces. Converter slag is added to the reverberatory furnace as a flux and the product separates into two layers, the top layer of slag being run off continuously to waste, as it contains less than 0.05 p.c. of copper and nickel, the lower layer being a copper-nickel matte about 16 p.c. nickel, 9 p.c. copper, 40 p.c. iron, 28 p.c. sulphur. The matte is "blown" in horizontal converters; the iron, which is oxidised by the air, combines with added silica, to form a slag which is then returned to the reverberatory furnaces.

The product may then be subjected to one of several processes. The Orford process depends on the fact that copper sulphide is much more soluble in sodium sulphide than is nickel sulphide. The matte produced by the converters is therefore crushed, mixed with nitre-cake or sodium sulphate and coke, and smelted. The product, when cast, separates into two layers, the "tops" being treated for recovery of copper, the "bottoms" for the production of pure nickel. Another process is to cool the matte from the converters in such conditions that the nickel and copper sulphides crystallise separately. After crushing, the sulphides can then be separated by

Sir W. Nicholson,  
British artist

flotation. In both processes concentration is improved by repeating, and the final product can be roasted to oxide and then reduced with carbon to a rather impure nickel, which can be refined by electrolysis; the anode sludge from this last process contains all the precious metals, which at Acton, Ont., are recovered and then purified.

Two other processes produce pure nickel directly from the bessemerised matte. About 20 p.c. of the Canadian matte is sent after a preliminary roast to Clydach, S. Wales, to be treated by the Mond process. The matte is calcined to remove most of the sulphur, leached with dilute acids to remove some of the copper, and dried. The nickel is then reduced by water gas at 350° to 400° C., the reduction being effected chiefly by the hydrogen present in the gas, so that the waste gas is high in carbon monoxide and thus suitable for the next stage, which depends on the formation of a volatile nickel carbonyl,  $\text{Ni(CO)}_4$ . This is volatilised at 60° C. and the resulting gas is then decomposed at 180° C. to pure metallic nickel and carbon monoxide gas. Some of the nickel carbonyl is condensed to a liquid in a medium-pressure plant, so as to yield, when it is decomposed, pure carbon monoxide for boosting the other gases. Bottoms from the Orford process are suitable for the Mond process. The Hybinette process, used in Quebec, involves the direct electrolysis of the cemented matte under special conditions with bagged anodes. The copper is first leached out and treated electrolytically in separate tanks.

The New Caledonian ore, a silicate containing little or no sulphur, and copper, is smelted with gypsum to give a nickel-iron matte, which is roasted, smelted with silica, bessemerised, and the pure matte again roasted to nickel oxide, which can be reduced with carbon to nickel.

Pure nickel is silvery-white with a high lustre. Much commercial nickel is hard and rather brittle, owing to the presence of small amounts of various impurities; the pure metal is malleable and ductile, rather harder and stronger than iron. It is magnetic, though less so than iron. Nickel has a high melting point and is resistant to abrasion. The addition of small amounts of manganese or magnesium as deoxidisers produces "malleable" nickel, which can be hot or cold-rolled, drawn into

wire, forged, and cast. Its resistance to corrosion makes it suitable for cooking utensils and laboratory and dairy apparatus. Pure nickel is used in many countries, e.g. India, for coinage. Iron, copper, zinc, brass, and many other alloys are electroplated with nickel, the plating being carried out in lead- or rubber-lined tanks; if high current densities are used, the solution is agitated by blowing compressed air into the tanks. Nickel-plating is used to improve the appearance of articles, and to increase their resistance to corrosion; it is also used as a basis for chromium plating, to give a very bright finish.

Of non-ferrous alloys of nickel, the widest in range are the cupronickels (*q.v.*). Nickel and copper are mutually soluble in all proportions. Up to 15 p.c. nickel, the alloys retain a coppery colour, but the 20 p.c. nickel alloy is white. Nickel silvers (formerly called German silver) are alloys of nickel with copper and zinc. They have a pleasant colour and many of them are stronger and more resistant to corrosion than is brass. They are the basis for E.P.N.S. (electro-plated nickel silver) in cutlery; and are also used architecturally. Nickel-chromium and nickel-chromium-iron alloys have many high temp. applications as they do not oxidise or corrode readily; they are used to make electric furnaces. Special nickel and chromium alloys were developed to withstand the very heavy corrosion and stresses in jet turbine engines. A very powerful permanent magnet material contains 10 p.c. aluminium, 18 p.c. nickel, 12 p.c. cobalt, 6 p.c. copper, and 54 p.c. iron. Alloys containing c. 36 p.c. of nickel have an unusually low thermal expansion.

But most nickel, which forms solid solutions with iron in all proportions, is used in steel alloys. The ordinary nickel steels are about 3.5 p.c. nickel; they are used for automobile parts, bridges, locomotive forgings and castings, etc. The steels with low carbon content are used for case-hardening. The nickel-chromium steels have excellent physical properties. Nickel is also sometimes added to cast irons. Various nickel salts are used in plating, and as catalysts. *See Alloy; Copper; Metallurgy; Mond; Nickel-Chrome Steels.*

**Nickel.** Popular name of U.S. coin, value 5 cents. Except for a period during the Second Great War when an alloy of silver, copper and manganese was used, the coin

has been made of 25 p.c. nickel and 75 p.c. copper.

**Nickel Blooms.** Group of hydrated and oxidised nickel minerals which form on the exterior of primary nickel minerals. They are all green in colour and are useful indicators of the presence of nickel mineralisation. The nickel blooms include anabergite, a hydrated nickel arsenate; morrenosite, hydrated nickel sulphate; and zaraitite, a hydrated basic nickel carbonate.

**Nickel-Chrome Steels.** Group of alloy steels. Such steels have up to  $4\frac{1}{2}$  p.c. nickel and  $1\frac{1}{2}$  p.c. chromium, with varying amounts of carbon. Those with about 0.15 p.c. carbon are suitable for case-hardening (*q.v.*); those with about 0.35 p.c. are easily hardened and tempered, in which condition they are always used. They have good resistance to fatigue and wear, and are therefore suitable for armour-plate and for automobile and aero-engine parts. A tendency to brittleness on tempering is eliminated by the addition of a small amount of molybdenum. Stainless steels have much larger amounts of nickel and chromium. *See Case-hardening; Chrome Steel; Chromium; Steel.*

**Nicobar Islands.** Group of islands in the Bay of Bengal, attached to the dominion of India. Of the 19 islands 12 are inhabited. They lie S. of the Andaman Islands, to which they are attached administratively, and from which they are about 75 m. distant. The natives produce copra. The group was ceded to Britain by the Dutch in 1869. Japanese forces occupied the islands June 13, 1942, until the defeat of Japan in 1945. Area 635 sq. m. Pop. 9,481.

**Nicodemus.** Biblical character. A Pharisee and member of the Sanhedrin, he was converted to a belief in the doctrines of Christ, but, afraid to make open confession of his faith (John 3, *vv.* 1-21), raised no protest when Jesus was condemned to death. After the crucifixion, stricken with remorse, he assisted Joseph of Arimathea in the burial of the body of Jesus (John 20, *v.* 39).

**Nicola, ENRICO DE** (b. 1877). First president of Italy. *See N.V.*

**Nicolai, CARL OTTO EHRENFRIED** (1810-1849). German composer. Born at Königsberg, June 9, 1810, he studied music at Berlin, and became organist at the chapel of the Prussian embassy at Rome, 1833. He composed a series of operas in the taste of the day, e.g. *Enrico Secondo*, and *Rosmonda*

d'Inghilterra, 1840, and was conductor at the court opera at Vienna, 1841-47. During his appointment there his operas *Templario*, 1841, and *Die Heimkehr des Verbannten*, 1844, were produced. His most popular work, however, was *Die lustigen Weiber von Windsor* (The Merry Wives of Windsor), first performed in Berlin, 1849, and in London (as *Falstaff*), 1864. The overture holds a permanent place in concert repertory. Nicolai died May 11, 1849.

**Nicolaitans.** Heretical sect which arose in the second century in the Christian Church. Their doctrines are associated with that of Balaam (Rev. 2, v. 14; Jude; 2 Pet. v. 1). Regarding as obsolete the injunctions of Deut. 23, vv. 17-18, and perhaps affected by the pagan rites connected with the worship of Dionysus and Aphrodite, they seem to have adopted a form of fanatical libertinism which attached to itself other heresies. The alleged leadership of the sect by Nicholas the deacon and proselyte of Antioch is unproven.

**Nicoll, Sir William Robertson** (1851-1923). A British journalist and theologian. Born at Lumsden, Aberdeenshire, Oct. 10, 1851, and educated at Aberdeen university, he was a Free Church minister from 1874 to 1885. While a minister at Kelso he was literary adviser to an Edinburgh publisher, and in 1884 was appointed editor to *The Expositor*. He founded *The British Weekly*, 1886; *The Bookman*, 1891; *The Woman at Home* (in cooperation with Annie S. Swan), 1893, and other periodicals, and acted as literary adviser to Hodder & Stoughton (*q.v.*). Under his editorship *The British Weekly* became a journal of national influence. His weekly article, *The Correspondence of Claudius Clear*, was a popular feature.

He was not only a leader in the literary life of his time, but took a prominent part in social reform and politics. He was knighted in 1909, and made a companion of honour in 1921. He wrote extensively on literature and theology, his works including *Life of James Macdonell*, 1890; *The Return to the Cross*, 1897; *Letters on Life*, 1901; *My Father*, 1908; *Life of Ian MacLaren*, 1908; and *A Book-*

*man's Letters*, 1913. He edited *The Expositor's Greek Testament* and the *Works of Charlotte Brontë*. He died May 4, 1923.

**Nicolle, CHARLES** (b. 1866). French bacteriologist. He was born at Rouen, Sept. 21, 1866, and in 1895 became head of the bacteriological laboratory of his native city. In 1903 he was appointed director of the Pasteur Institute at Tunis, where he devoted himself to the study of the infectious diseases of N. Africa. In the course of that work he discovered, in 1909, the fact that lice transmit the bacillus of typhus, a fact subsequently confirmed by Ricketts and Prowazek 1910 and 1913 respectively. For this and other contributions to the fight against epidemics he was awarded the Nobel prize for medicine in 1928.

**Nicol Prism.** Prism of Iceland spar, used as a source of plane-polarised light. If a parallel beam of light strikes obliquely on the surface of a rhombohedron of Iceland spar it is split into two parts. The refractive index for one ray (the ordinary ray) is a constant, viz. 1.658 for sodium-D lines, while for the other (the extraordinary ray) it varies between 1.486 and 1.658 according to the angle of incidence. Hence, except along the optic axis when both travel at the same speed, the extraordinary ray has a higher speed than the ordinary ray. The Nicol prism (named after William Nicol and invented in 1832) is a device used to separate the two rays so as to give a single beam of plane-polarised light. For this purpose a prism is sawn into two parts along a diagonal plane, perpendicular to the principal plane of one end face. The cut faces are cemented together with a thin transparent film of Canada balsam with refractive index (1.530) intermediate between those of the ordinary and extraordinary rays. With properly chosen crystal dimensions the ordinary ray strikes the balsam layer at an angle exceeding the critical and so is reflected towards the side of the crystal where it may be suitably absorbed.

**Nicolson, HAROLD** (b. 1886). British writer, diplomatist, and politician. Son of the 1st Baron Carnock, he was born at Teheran, Persia, Nov. 21, 1886, and educated at Wellington, and Balliol, Oxford. He entered the diplomatic service in 1909. A member of the British delegation to the peace conference, 1919, when he was closely associated with Curzon, he was later attached to the legation at Tehe-

ran, 1925, and to the embassy at Berlin, 1927. Retiring in 1929, he turned to journalism. Entering

Harold Nicolson,  
British writer

politics in 1931 as a member of the short-lived New Party, he represented W. Leicester as National Labour M.P., 1935-45, and was parliamentary secretary to the ministry of Information, 1940-41. In 1947 he joined the Labour party. A popular broadcaster, he was a governor of the B.B.C. 1941-46.

In his *Life of Lord Carnock*, 1930, he gave a brilliant exposition of the events and causes leading to the First Great War; and in *Peacemaking*, 1933, and *Lord Curzon: The Last Phase*, 1934, he examined with equal skill the tendencies of post-war diplomacy, the latter book giving as well a fine estimation of Curzon's character. His other works included *Lives of Verlaine*, 1921; *Tennyson*, 1923; *Swirburne*, 1926; and *Dwight Morrow*, 1935; *Some People*, 1927; *Small Talk*, 1937; *The Desire to Please*, 1943; *The Congress of Vienna*, 1946. For many years he contributed a weekly essay to *The Spectator*. He married Victoria Sackville-West (*q.v.*), with whom he collaborated in *Another World Than This* (anthology), 1945.

**Nicomedia.** Ancient city of Bithynia, Asia Minor, the modern Ismid. It stands at the N.E. end of the sea of Marmara, and was founded 264 B.C. by Nicomedes I of Bithynia. After the quadripartite division of the Roman empire by the emperor Diocletian it became the seat of the government of Diocletian himself. Hannibal committed suicide by poison in Nicomedia, and it was the birthplace of the historian Arrian.

**Nicosia** or **LEVKOSIA**. Capital of Cyprus. It stands in the centre of the island, 25 m. N.W. of the seaport Larnaca. It retains its high Venetian walls, and contains a fine Gothic edifice, once the cathedral of S. Sophia and now a mosque, and English and other churches. It is the see of a Greek archbishop and the seat of the British governor. Silk, leather, and woollen goods are manufactured. From the time of Constantine the Great until 1567 it was 9 m. in circumference, but the Venetians reduced it to 3 m. and fortified it, demolishing temples, palaces, and

Sir W. R. Nicoll,  
British journalist  
*Hoppe*

beautiful monuments. In 1570 it was taken by the Turks. Nicosia has one of the Middle East's chief airports. Pop. 34,463.

**Nicosia.** City of Sicily, in the prov. of Enna. Among the heights of Monte San Giovanni, at an alt. of 2,840 ft., 42 m. W.N.W. of Catania and 21 m. by road from the rly. station for Leonforte, it has a fine Norman cathedral and other churches, some damaged in the Second Great War. Sulphur springs are near by and salt is mined. A Lombard dialect is spoken. Destroyed by the Saracens, it was rebuilt by the Normans.

**Nicot, JEAN** (1530-1600). A French diplomat and philologist. Born at Nîmes, the son of a notary, he became a lawyer in Paris in 1554. Favoured by Henry II, he was ambassador to Lisbon in 1559, and there became acquainted with the properties of the plant later known as tobacco, and called in his honour *nicotiana*, which he introduced to Catherine de' Medici. Recalled in 1561, he spent his later years in philological work. He died in Paris, May 5, 1600. See *Nicotine*.

**Nicotiana.** Genus of herbaceous plants, of which the most important are the tobacco plants. See *Tobacco*.

**Nicotinamide** ( $C_{10}H_{14}ON_2$ ). Yellowish oil used in 25 p.c. solution as a respiratory stimulant. It may be administered orally or by injection. Nicotinamide is also used in the treatment of the vitamin B deficiency disease known as pellagra (*q.v.*).

**Nicotine.** Liquid alkaloid extracted from the leaves of *Nicotiana tabacum*, the tobacco plant. Colourless, with a strong, stupefying, irritating odour, it is soluble in water, alcohol, and ether, and turns brown on exposure to the air. Tobacco contains from 1 to 8 p.c. of the liquid. Pure nicotine is one of the most deadly poisons known, rapidly causing death by paralysing the cardiac and respiratory centres in the brain. Nicotine was probably the first insecticide employed in Great Britain, in the middle of the 18th century for controlling plant lice on neectarines. Nicotine for insecticidal use is made from waste tobacco. See *Tobacco*.

**Nicotinic Acid.** Part of the vitamin B complex, which helps to prevent pellagra (*q.v.*). It has none of the action of nicotine.

**Nicoya, GULF OF.** Inlet of the Pacific Ocean on the W. coast of Costa Rica, Central America. Protected W. by the peninsula of Nicoya, it penetrates inland about

Niederwald, Germany. Colossal statue of Germania, erected 1877-83, in the Niederwald to commemorate the founding of the German empire

50 m., its breadth varying between 20 m. and 30 m. The coasts are mountainous and picturesque. On the E. shore is Punta Arenas, the Pacific port of Costa Rica. The village of Nicoya is about 80 m. N.W. of San José.

**Niotheroy or NITEROI.** City of Brazil. The capital of the state of Rio de Janeiro, it is on the N. shore of the bay of Rio de Janeiro. In one of its suburbs is a popular sea-bathing station, Icaraty. Flannel, felt, soap, spirits, and tobacco are manufactured. Pop. est. 143,000.

**Nictitating Membrane or THIRD EYELID.** Thin membrane at the side of the eye, which can be drawn rapidly across the cornea to clean the surface of the eye. It is best developed in the birds, but can also be observed in the reptiles and in some batrachians. In mammals generally it is but slightly developed, and it is rudimentary in man. See *Eye*.

**Nidd.** River of the W. Riding of Yorkshire, England. It rises on Great Whernside, and flows E., S.E., and N.E. through Nidderdale, past Pateley Bridge, Ripley, and Knaresborough to the Ouse, 8 m. above York. It is dammed above Pateley Bridge, and thus provides water for Bradford.

**Niedersachsen** (Ger., Lower Saxony). Region of Germany. Originally Niedersachsen embraced a wide area centred on Hanover, and taking in a large proportion of the Dutch, N. German, Pomeranian, and Thuringian pop. As such it was one of the ten *Kreise* of the Holy Roman Empire. The name was revived after the Second Great War and applied to a homo-

geneous area within the British zone of occupation; this was constituted a *Land* in 1946 (see Lower Saxony). Except for Hanover (*q.v.*), its capital, the towns of the region were less damaged by the war than those of surrounding areas. Economically the area is well balanced, numbers in agriculture and in trade and industry being about equal.

**Niederwald.** Mt. ridge of Germany. It forms the W. end of the Taunus at the upper end of the great gorge of the Rhine. Dominating the outlook from the river is the colossal statue, Germania, erected 1877-83 to commemorate the founding of the empire in 1871. S. is the Rheingau, famed for its mineral springs and vineyards.

**Niello** (Ital. from late Lat. *nigellum*, black enamel). Inlaying gold, silver, and bronze with a black metallic alloy of silver, copper, and lead, to which, when molten, there is added powdered sulphur. Since this alloy appears in the inlay as a deep black, silver has been the chief base on which the art has been practised, giving the greatest contrast between inlay and base.

The earliest extant example of the art is a 1st century bronze statue of a Roman general, in the British Museum. There are fine examples also in the church of the royal palace at Hanover; in S. Sophia, Istanbul; and in many churches in Italy and Russia. The art has been popular in India for many centuries. It is said that niello first suggested the method of printing from engraved metal plates. Certainly prints are in existence in the British and other museums of a niello portrait of the Virgin made in 1452, and now in the Opera del Duomo, Florence.

**Niemen, NYEMAN, or MEMEL.** River of the U.S.S.R. Its head-streams rise W. of Minsk, in White Russia S.S.R., and it flows generally W. to Grodno, then crosses into Lithuania S.S.R. to flow N. and W. past Kaunas. It enters the Kurisches Haff, an arm of the Baltic, S. of Memel, after a course of 550 m. The area of its basin is approx. 35,000 sq. m. Except for occasional obstructions, one being the Devil's Dam above Kaunas, navigation is practicable to Grodno. On a raft in the Niemen, Napoleon and Alexander I signed the treaty of Tilsit, July 7, 1807. In the First Great War the Russians withdrew to the Niemen after their defeat at Tannenberg, Aug., 1914, and in Feb., 1915, they were driven back to it again.

**Niemöller, MARTIN** (b. 1892). German ecclesiastic. Formerly a naval lieutenant and commander of a U-boat in the First Great War, he became a pastor in the Evangelical Church at Dahlem, Berlin. In 1933 he led a league of clergymen in their campaign against the appointment of Bishop Müller. Dismissed next year by the Nazis, he refused to retire, and continued to defy their attempts to subordinate the church to the state. When in 1937 a hundred Protestant clergymen were arrested, Niemöller was kept in custody. In

Martin Niemöller,  
German ecclesiastic

March, 1938, he was sentenced to seven months' imprisonment, and was in Sachsenhausen concentration camp until released by the Allies in May, 1945. He was regarded as a martyr, but in 1947 a tribunal found that he had offered a degree of support to Hitler, and he was deprived of his status as a Nazi victim.

**Niepee, JOSEPH NICÉPHORE** (1765-1833). French physicist. Born at Chalon-sur-Saône, March 7, 1765, he was commissioned in the army in 1783 and during 1795-1801 was administrator of Nice. Retiring from the army, he joined his brother Claude (1763-1828) in mechanical and chemical experiments. The idea of obtaining photographs first suggested itself in 1813, and in 1827 Niepee succeeded in producing one on a metal plate, and was the first to evolve a photographic process in which the picture was unaffected by exposure to light. From 1829 he associated himself with Daguerre (*q.v.*). He died at Gras, July 3, 1833.

**Nierembergia.** Genus of perennial herbs of the family Solanaceae, natives of S. America. The stems as a rule are more or less procumbent, or even prostrate. The tubular flowers vary from a pale tint of violet to blue or white. Several species are cultivated, of which *N. frutescens* is shrubby, with slender leaves and pale blue flowers. *N. gracilis* is a downy plant with narrow leaves and white flowers, with yellow tube. *N. rivularis* has matted, creeping stems and spoon-shaped leaves; the flowers are white, tinged with yellow or rose.

**Nietzsche, FRIEDRICH** (1844-1900). German philosopher. Born at Rocken, in Prussian Saxony,

Oct. 15, 1844, son of a pastor of remote Polish extraction, he was educated at Naumburg grammar school, at the famous school of Pforta, and at Bonn and Leipzig universities. After a year's compulsory service in the artillery, he returned in 1868 to Leipzig, obtained his degree, and at 25 was professor of classical philology at Basel. Here he lectured with success until in 1879 ill-health compelled him to resign. The university granted him a pension of £120 a year, and with this and small private resources he lived mostly in Italy and Switzerland, until an apoplectic fit in 1888 was followed by insanity. He died in his sister's house at Weimar on Aug. 25, 1900.

He early became more attentive to the nature of the Greek genius than to the technicalities of Greek literature. He concluded, in *The Birth of Tragedy*, 1872, that the original genius of Greece, and the proper idea of mankind, was an instinctive and joyous creativeness—the Dionysiac element—which was later ruined by intellectualism and fixed moral rules—the Apollinist element.

Essentially a poet, Nietzsche never framed a philosophy, or systematically arranged his reflections on life, but his early ideal steadily developed. Against the prevailing intellectualism he passionately pleaded for strength, will, impulse. He knew little of science, and when Darwinism spread, he superficially acclaimed it as the gospel of eternal struggle, of the triumph of the strong.

He heatedly attacked pity and humanitarianism, and, on the ground that it had introduced

Friedrich Nietzsche,  
German philosopher

these things into Europe, bitterly assailed Christianity. Few understood or appreciated his works, and he imagined a group of "free spirits," sharing his ideas, who might one day exist. These become, in his writings, the Beyond-Men or Supermen. The code of morals of these "master spirits" must differ from the prevailing "slave-morality," and his later works were almost entirely devoted to a "transvaluation of values," or a reconsideration of moral standards. These are the main ideas of his chief works, *Human, All-Too Human*, 1876-80; *The Joyous Wisdom*, 1882; *Thus Spake Zarathustra*, 1883-84; *Beyond Good and Evil*, 1886; *Genealogy of Morals*, 1887.

His lyrical praise of struggle, and ultimately of war, and his scorn of humanitarianism and morality were powerful influences in Germany. *Pron.* Neetch-uh.

**Bibliography.** Works, 18 vols., Eng. ed. O. Levy, 1909-13; *Life and Work*, M. A. Mücke, 1908; *Philosophy of F. N.*, F. C. S. Schiller, 1913; *Philosophy of N.*, H. L. Mencken, 3rd ed. 1913; *F. Lavrin, 1948; *Nietzsche*, H. A. Reyburn, 1948.

**Nieuport** (Flemish *Nieuwpoort*). Town of Belgium, in the prov. of W. Flanders. It lies on the Yser, 10 m. S.W. of Ostend, and is connected by rly. with Dixmude and by canal with Furnes. Some fishing is carried on. Nieuport-Bains, 2½ m. N., is a small watering-place in the dunes at the mouth of the Yser.

Originally known as Santhoven, Nieuport was a trading centre of note in the Middle Ages, and was unsuccessfully besieged by the French, 1489. The Spaniards were defeated here in the battle of the Dunes by Maurice of Nassau, 1600. During the First Great War the town was completely ruined, losing its hôtel de ville, 15th century cloth hall, 12th-15th century church of Notre Dame, and Templars' Tower. At the extreme N. of the Western front and an important point in the battle of the Yser, Oct., 1914, it was held by French troops after the Belgians were withdrawn, and in the summer of 1917 by the British 4th army. After the war the buildings were restored in their original styles. During the evacuation of Dunkirk in 1940 by

Nierembergia. Flowers and foliage  
of *N. rivularis*

the B.E.F. Nieuport was included in the perimeter defences. It was then occupied by the Germans until liberated by the 1st Canadian army on Sept. 8, 1944.

**Nieuwveld.** Mt. range in the Cape prov., S. Africa. Running W. to E. south of the Great Karroo, the mts. form an escarpment joined through the Stormbergen and Sneeuwbergen with the Drakensbergen, and are the edge of the great African plateau.

**Nièvre.** Dept. of France. In the centre of the country, its area is 2,658 sq. m. It includes the mountainous district of Morvan in the E., and less elevated regions in the N., while in the W. the dept. is flat. The chief rivers are the Loire, Nièvre, Allier, Aron, Cure, and Yonne. An agricultural, but not very fertile, district, it produces some cereals and potatoes; cattle and sheep are reared in large numbers. There are some vineyards and much of the land is forest. There are coal and iron mines in the dept. and some large ironworks. Nevers is the capital; other places are Château Chignon, Clamecy, Cosne, and Fourchambault. Before the Revolution most of Nièvre was covered by the province of Nivernais. Pop. 248,559.

**Nigella.** Genus of annual herbs of the family Ranunculaceae, natives of the Mediterranean region. Popularly known as Love-in-a-mist and Devil-in-a-bush, they bear variously coloured blue, white, and yellow flowers surrounded by graceful feathery foliage.

**Niger.** Territory of French West Africa, lying to the S. of the Sahara, with French Sudan on the W., Chad territory on the E., and British Nigeria to the S. Desert in the N., it is well wooded cattle country in the S., its chief crop being ground nuts. Big game abounds. The capital is Niamey. Area 499,410 sq. m. Pop. 2,000,000 natives; 1,000 whites.

**Niger.** A river of W. Africa. It rises in the mountainous zone on the frontiers of Sierra Leone and French Guinea, near Timbukunda. After a devious course of some 2,500 m., during which it passes through French territory and N. Nigeria, it enters S. Nigeria at Idah, and falls into the Gulf of Guinea through a large estuary in the central portion of the coast of S. Nigeria. From its source the main river flows N.E. to its junction with the Milo, and continuing in the same general direction, reaches the neighbourhood of Timbuktu, whence the direction

is mainly E. almost to long. 0°. From this point it flows generally S.E. to the sea. The principal tributaries are the Milo, Bakhoy, Sokoto, Kaduna, and Benue. The delta begins near Abo, about 80 m. from the sea, and has numerous mouths, the chief being the Nun, Forcados, and Bonny.

The headwaters are connected with the coast by the French rly. from Kankan, on the Milo branch, to Kurussa, on the main river; and across French Guinea to the port of Konakry; and by the rly. from Kulikoro to Bamako, thence to Kayes and Dakar. The river is navigable between Kurussa and Bamako, and for a short distance above the latter place. It is again navigable from Kulikoro and Ansongo by small launches, and under favourable circumstances as far as Niamey. In Nigeria the river is divided into two navigable sections, broken by the rapids N. of Jebba, although above Sekachi it is navigable as far as Gaya in French territory and with intervals up to Ansongo. The lower river suits small ocean-going vessels as far as Baro, but navigation is increasingly difficult.

Although known to the Greeks and mentioned by Ptolemy and later writers, the Niger generally was supposed to run W. instead of E., and is so marked on many of the old maps. In 1795 Mungo Park, under the auspices of the African Association, was sent to explore its sources, and travelled along the river from the Gambia estuary to Segu. In 1805 he again reached the Niger, but was killed near Bussa, when crossing the rapids beyond that place.

In 1822 Hugh Clapperton and Dixon Denham started from Tripoli and reached Bornu and the country N. of the Niger. During another expedition in 1825 Clapperton died at Sokoto, but his companion, Richard Lander, again explored the lower Niger and determined its exact course. Other expeditions followed, notably those under Macgregor Laird in 1832, Lander in 1834, Richardson and Barth, who crossed from Tripoli, Zweifel, and Moustier, in 1879, and Brouet, who in 1885 discovered the Timbi source.

**Bibliography.** Travels. Mungo Park, 1799; Journal, R. and J. Lander, 1833; Travels and Discoveries, H. Barth, 1857-58; The Niger Sources, J. K. Trotter, 1897; Mungo Park, P. Germann, 1924.

**Nigeria.** British colony and protectorate in W. Africa. British influence began around Lagos,

which was bought from a native chief in 1861, and achieved a separate existence in 1886 as the colony and protectorate of Lagos. That year the National African Co., which had commenced operations in the Niger valley, became the Royal Niger Co.; its activities continued for 13 years, and it surrendered its charter in 1899. Two protectorates of N. and S. Nigeria were inaugurated on Jan. 1, 1900. In 1885 the protectorate of the Oil, i.e. palm oil, rivers had been established; this became the Niger Coast protectorate in 1893, and in 1900 was absorbed by S. Nigeria. In 1906 S. Nigeria and Lagos were joined, and in 1914 the colony and protectorate of S. Nigeria was combined with N. Nigeria to form the existing colony. A strip of German Cameroons was administered under mandate from 1919. Lagos is the capital.

The territory is under a governor, who is assisted by an executive council consisting of a few senior officials and three additional members, and by a legislative council, remodelled in 1947 to consist of ex officio, nominated, nominated but unofficial, and elected members; of the 45 members, 25 are Africans. Various groups of provinces have each a house of assembly. Altogether there are 23 provinces, each under a resident. There are a supreme court and eight judicial divisions.

The lower Niger and its great tributary, the Benue, divide the country into three parts: the wide land N. of both rivers on the low plateau of N. Africa with the central heights attaining 3,000 ft. over a wide area; the S.W. corner bounded by the Niger, the sea, and Dahomé, where are the Yoruba Highlands; and the S.E. corner, much lower except in the area detached from Cameroons. The Lagos coast was once known as the Slave Coast, but in 1917 slavery was abolished as a legal status; slave dealing had ceased, and the slave markets were suppressed by the native rulers. The trade lasted longest in the N., on the edge of the Sahara, where the Mahomedan Hausas and Fulas long retained the system of domestic slavery. In religion the people are more animists or Christians than Muslims.

The S. is tropical forest as far inland as Ibadan; the rest is savanna. Rainfall is heavy during summer, reaching an annual average of 151 ins. at Bonny. The S. yields palm oil and kernels,

Nigeria. Map of the British West African protectorate traversed by the rivers Niger and Benue, and one of the most densely populated parts of Africa

rubber, ground-nuts, hides, coffee, cocoa, kola nuts, etc.; in the N. is the tin-mining area. Coal is mined at Udi. Deposits of silver, galena, manganese ore, and monazite have been found, and during the Second Great War the mining of columbite was developed. Trade passes seawards by many ports, of which the chief are Lagos, Port Harcourt, Bonny, and Calabar; it concentrates from the French territory to the N., W., and E. on Kano, long a famous caravan centre, and now the railhead for Lagos. There are about 2,340 m. of rly., while 48,275 m. of roads are planned. Nigeria's area is approx. 372,674 sq. m. Pop. 21,826,389, denser than any other part of Africa except the Nile valley.

Nigerian troops to the number of 96,000 fought in the Second Great War, in E. Africa and Burma; but the colony's principal war contribution was increased production of foodstuffs, minerals, especially tin, and rubber. Capital expenditure was provided

by the Colonial Development and Welfare Act of 1940; conscription of labour was introduced, but was discontinued in 1944. In 1946 a development plan was adopted, covering schemes for improved water supplies, telecommunications, waterways, and health and education services, and wide extensions in forestry, cattle-raising, and agriculture. Of the estimated cost of £55,000,000, grants provided £23,000,000, while £17,000,000 was raised by loans.

Leprosy is an important problem in Nigeria, where there are over 400,000 known lepers. Experimentation carried out here was responsible for the development of a new drug (D.A.D.P.S.) now in use throughout the world (see Leprosy). See also Abeokuta; Bauchi; Benue; Lagos; Niger.

**Bibliography.** N under British Rule, Su W. Geary, 1927; Nigeria, W. R. Crocker, 1936; History of Nigeria, A. C. Burns, 3rd ed. 1942; Native Economics of Nigeria, D. Forde and R. Scott, 1946; N: Outline of a Colony, C. R. Niven, 1946.

**Night.** Interval between sunset and sunrise. Its length varies according to the seasons and the latitude. At the equinoxes it is twelve hours in length on every part of the earth, lengthening afterwards in one hemisphere and shortening in the other until the solstices. At the poles the period of night lasts six months.

**Night Blindness.** For this condition see Blindness.

**Night Club.** Place of entertainment open after the closing of normal licensed premises, for members and their invited guests only. Food and alcoholic drinks are available, and there is generally a band for dancing and a cabaret show. The first night clubs were opened in London in 1919 to provide entertainment on the lines of Paris cabarets without contravening the licensing laws; they spread to the U.S.A., but American clubs were not restricted to members, and the term there became synonymous with cabaret. Most London night clubs are

conducted on the "bottle-party" system, whereby a member orders in advance a whole bottle of liquor from a wine-merchant, and has it stored at the club and produced on request.

During the Second Great War chief officers of police were given power to close clubs where there was drunkenness or disorderly conduct, or to limit the hours of opening if the club was frequented by war workers.

**Night Fighter.** Type of aircraft developed by the R.A.F. in the Second Great War to combat night air attacks. Unlike the day fighter, which is generally a single-seater, the night fighter carries a pilot and navigator. The first British example was the Boulton-Paul Defiant, which was equipped with a power-operated gun-turret and, after service as a day fighter in the battle of Britain, went into action at night early in 1941. These aircraft at first had to rely upon ground searchlights picking up and illuminating enemy bombers, but later were themselves fitted with searchlights. With radar they could track down and attack bombers unseen. Eventually twin-engined night fighters, Beaufighters and Mosquitos, were introduced, their range, armament, and speed making night bombing too costly for the Germans, whose lack of efficient night fighters was one reason for the success of the R.A.F. in bombing German cities by night. See Air Defence; Fighter; Radar.

**Night Heron** (*Nycticorax nycticorax*). Species of small heron, common on the Continent of Europe and widely distributed in the Eastern hemisphere. About two ft. long, with greenish plumage on the back, purple breast, and long white plumes at the back of the head, it commonly nests in colonies in low trees, is usually found in swampy woods, and is most active at night. It is doubtful if it ever bred in Great Britain, which it visits in the spring and autumn. The name is given in America to another species, *N. naevius*. See Boatbill; Heron.

**Nightingale** (*Luscinia megarhynchos*). Bird of the thrush family, famous for its sustained and varied

song, indulged in far into the night as well as by day. A native of Europe from England to its eastern borders and into Asia Minor, and from Copenhagen to N.W. Africa, its length slightly exceeds 6 ins. Its upper parts are russet brown and the underside is brownish white.

Arriving in England in mid-April, the bird ranges only as far N. as S. Yorkshire, and as far W. as the valley of the Exe. It visits parts of S. Wales, but not Ireland.

The nest, composed of dead leaves and grass, is placed on or near the ground in the tangled vegetation of copse or hedgerow, and contains four or five olive-tinted, polished eggs. While the hen is sitting the cock frequently sits on a branch above and pours out his rich song, undeterred by the presence of an appreciative human listener only a few feet away. The nightingale feeds chiefly on the ground, consuming worms and various insects, and later the wild berries. The song is not heard much after mid-June; but the soft *wheel* call-note and the alarm *kur*, *kur* denote its presence until it departs in Aug. or Sept.

The Eastern or thrush-nightingale (*L. luscinia*), of Europe E. of the Rhine, is somewhat larger, with the breast spotted faintly; and the Persian nightingale (*L. hafizi*) occurs farther E. from the Caucasus through Persia to Sinkiang and occasionally to India.

The nightingale figures in the mythologic story of Tereus and Philomela, the latter being transformed into the bird, whose plaintive song is supposed to be a recital of her wrongs. It inspired Keats to the most celebrated ode in the English language. The name is derived from A.S. *nihtegale*, meaning singer of the night. See Eggs colour plate.

**Nightingale, FLORENCE** (1820-1910). British reformer. Born at Florence, Italy, May 12, 1820, she was the younger daughter of W. E. Nightingale, a moneyed, cultured, well-connected man. Her maternal grandfather, William Smith, was a strong advocate of

the abolition of slavery. Florence spent her early life in the family homes first at Lea Hall, Derbyshire, then (from 1825) at Lea Hurst, Derbyshire, in summer, and Embley Park, Hants, in winter. She was brought up to the life of visiting, entertaining, and casual philanthropy then customary for young

ladies of leisured family, but in addition received a wide education not usual at that day. In 1845 she planned to become a nurse at Salisbury Hospital, and then to set up a sort of "Protestant sisterhood, without vows, for

Nightingale. Male specimen of the European song-bird

Florence Nightingale  
Augustus L. Egg, National Portrait Gallery, London

women of educated feelings." But these plans came to nothing. Attended by a manservant, however, she was allowed to visit ragged schools, and during travels on the Continent visited hospitals in Rome and Paris, and contrived in 1851 to take a three months' training as a sick nurse at the institute of Protestant deaconesses at Kaiserswerth on the Rhine.

During the next year she wrote her *Suggestions for Thought to Searchers after Religious Truth*, amplified and printed (but never published) in 1859. In it she set down her own struggle to reach a philosophy through religion, and a poignant record of the frustration suffered by a woman of energy and active mind in her day. The Crimean war broke out in March, 1854, and the reports sent home by war correspondents of the neglect of the wounded and of the need of devoted women

Night Heron. Example of the European species

W. S. Berridge, F.Z.S.

to nurse them led her on Oct. 14 to offer her services to the War office. On the same day her friend Sidney Herbert, then secretary for War, wrote asking her if she would go out and supervise a nursing service. She acted immediately, chose her company, and on Oct. 21 sailed for the Crimea taking with her 38 nurses. She reached Soutari on Nov. 4, and found the barracks hospital dismal and dirty. There were no stores, no utensils, no soap, no towels, no hospital clothing. The sick and wounded lay in their uniforms, filthy and verminous.

Florence Nightingale's arrival was not welcomed; but with an outlet at last for her energy and organizing ability she set to work and by Dec., when 46 more nurses came out, she had produced some sort of order. It was said that she was on her feet 20 hours in the day; she allowed no woman but herself to be on duty at night, when the place of the other nurses was taken by orderlies. It was those night vigils that earned her the name the Lady of the Lamp. Defects of sanitation remained, and only after the death rate from cholera, typhus, and dysentery had risen in Feb., 1855, to 42 p.c. of cases in hospital was she able to persuade the War office to insist on reform. This brought the death rate down by June to two p.c. Then she made a tour of the hospitals about Balaclava. She remained in the Crimea until Aug., 1856, and returned to England to find herself a popular heroine. She asked that the recognition of her work should be the setting up of a school of nursing; £50,000 was collected, and the Nightingale school and home for nurses was established at S. Thomas's hospital, 1860.

The strain of her Crimea service had affected her health and she was henceforth a semi-invalid; but from her home in London she continued to write and advise, with the authority born of her experience, on all aspects of nursing and sanitation. In 1907 she received the O.M., the first woman to be thus honoured. She died at her home Aug. 13, 1910. Her notes on nursing, first published in 1858, were issued in a revised edition, *The Art of Nursing*, 1947. See *Nursing*. Consult also *Lives*, S. I. Tooley, 1905; E. T. Cook, 1913; G. C. Willis, 1931; *Eminent Victorians*, L. Strachey, 1918.

Irene Clephane

**Nightjar** (*Caprimulgus europaeus*). Migratory bird common in Great Britain during the

Nightjar. Specimen of this insectivorous bird, on the wing

summer, and spending the winter in Africa as far S. as the Cape. In shape it resembles a large swift, with a large, flat head and a wide, gaping mouth. It is called nightjar from its peculiar whirring cry, but flies silently by night in search of insects. The term goatsucker perpetuates an ancient and widespread delusion, due to its habit of hawking for flies round the udders of animals. The bird is about 10 ins. long, and its colour is grey, spotted and barred with yellow and brown. It lays two beautifully marbled eggs on the bare ground, usually close to a small bush or tuft of heather. The nightjar family includes many genera and about 90 species, including the N. American whip-poor-will. See *Eggs*, colour plate.

**Nightmare.** Dream accompanied by feelings of terror. Anciently supposed to be caused by an evil spirit, it was until recently believed to be due to digestive disorder. The newer theory of dreams regards this as only a precipitating cause, and ascribes nightmare to psychological processes. It is believed that certain primitive wishes in the subconscious mind are forcing themselves into the consciousness, and if they are not sufficiently disguised to produce the ordinary form of dream, but are likely to become clear to the sleeper, he awakes in a state of terror. See *Dream*.

**Nightriders.** Name given to terrorists in Kentucky, U.S.A., who in 1908 made destructive raids on the tobacco-growing fields. They were planters who had refused to come into a scheme for pooling crops so as to get the best possible price. In clashes

between the Nightriders and growers inside the organization, some lives were lost, and only about one-fifteenth of the normal crop was grown next year.

**Nightshade.** Folk-name for several species of plants. Woody nightshade or bittersweet is *Solanum dulcamara*, and common nightshade is *S. nigrum*, while enchanter's nightshade is *Circea luteiflora*. Deadly nightshade (*Atropa belladonna*) is a perennial herb of the family Solanaceae, a native of Europe and N. Africa. Several annual stems proceed from the same fleshy rootstock, and form a bush 3 or 4 ft. high, with large oval leaves. The large, solitary, bell-shaped flowers are dull purple

Nightshade. *Atropa belladonna*, or deadly nightshade

in colour, and droop on short stalks. The fruit is a large, shining black, globular berry. The whole plant is poisonous and smells unpleasantly. Hyoscyamine and atropine are obtained from the rootstock lifted in autumn, and from fresh leaves gathered when the plant is in flower.

**Nigri Sembilan** (nine states).

Collective name of a group of states in the Malay Peninsula, formerly one of the Federated Malay States and now a part of the federation of Malaya (q.v.).

Nigri Sembilan came under British rule 1873, and comprised the states of Sungai Ujong, Sri Menanti, Jelebu, Rembau, Johol, and Tampin. It entered the F.M.S. 1895. Area approx. 2,550 sq. m.; estimated pop. 296,000. It lies in the S.W. of the peninsula. The surface is mountainous in the interior, rising in Gunong Ledang, or Mt. Ophir, to 3,845 ft. The chief harbours are Port Dickson and Linggi. The valleys are fertile and the hill slopes heavily timbered, the principal products being timber, rice, rubber, spices, tapioca, and coffee. Tin, gold, and other minerals are mined. Seramban is the chief town.

**Nigrosine.** Black dye closely related to induline (a blue-black dye). By various modifications a long series of blue to black dyes soluble in spirit is produced. By sulphonation they are converted to water-soluble forms and find varied use in industry. Nigrosine is put into spirit stains and varnishes and in polishes. Used

in dyeing silk and in calico printing, it gives grey or blue-grey shades. *See* Dyes.

**Nihilism** (Lat. *nihil*, nothing). Name given to the tenets of the Russian revolutionary socialists. Though there had been for forty years parties holding similar views in Russia, it was due to Turgenev, in 1862, that the term nihilism came to be used. The attitude of mind was the result of the terrible conditions of living of the vast mass of the Russian people, and the main object of those who held it was the overthrow of government by force of any kind. The nihilists aimed at freedom of the press, freedom of speech, religious equality, equality of treatment for women, the land for the people, etc.

The nihilist movement began to become a force in 1860-70, and owing to its violent methods wholesale arrests were carried out during the next decade, some 4,000 people being tried in Russia in 1877-78 alone. In the latter year an attempt was made to assassinate Gen. Trepov; Gen. Mezentsev was killed in St. Petersburg; and in 1879 Prince Kropotkin was assassinated, and attempts were made to kill the tsar, Alexander II. His assassination in 1881 was followed by methods of extreme severity against the nihilists, who were gradually crushed, and new organizations came into existence which hoped to achieve the aims of nihilism by more constitutional means. *See* Anarchism. *Consult* *Memoirs of a Revolutionist*, P. A. Kropotkin, 1899.

**Niigata.** Seaport of Japan, on the W. coast of Honshu. It is the capital of Niigata prefecture and is near the mouth of the Shinanogawa. Its harbour is shallow, silts up with river alluvium, and is exposed to N. winds. Dredging operations have made some improvement. The trade is almost limited to traffic with Vladivostok and other Siberian harbours. Exports are mainly rice and soya beans, which are grown extensively in the prefecture. There are ironworks and chemical manufactures. The town is intersected by many canals. It is connected by rly. with other W. coast ports, Tokyo and Osaka, and is the port for the island of Sado, 32 m. away. Pop. 72,000.

**Nijinsky, VASLAV** (1890-1950). Russian dancer. Born at Kiev, Feb. 28, 1890, he was trained at the Imperial ballet school of St. Petersburg, and made his debut at the Marinsky theatre, 1907.

Two years later he went with Diaghilev to Paris, achieving spectacular success in Scheherazade. Matchless technique, dramatic ability, and an unusual ability to jump (he

was probably alone in being able to perform ten entrechats) made him the greatest male dancer of his age. As partner of Karavina in *Le Spectre de la Rose* he was outstanding. At

Covent Garden in 1911 he gave brilliant performances in *Petrouchka* and *Carnaval*. He was also the choreographer of *L'Après-midi d'un Faune*, 1912, and *Le Sacre du Printemps*, 1913; and during his last years evolved a system of choreographic notation.

After quarrelling with Diaghilev he formed his own company in 1913. He was interned in Austria in 1914, his release being secured by Diaghilev whose company he rejoined in the U.S.A. in 1916. Symptoms of mental disorder appeared, however, and after 1918 he never danced again. He lived in a Swiss sanatorium for 20 years, then in Budapest, Vienna, the U.S.A., and from 1947 in England, where he died April 8, 1950.

**Nijmegen, NIMEGUEN, OR NYMEWEGEN.** Town of the Netherlands, in the prov. of Gelderland. It lies on the left bank of the Waal, 10½ m. by rly. S. of Arnhem, and is a rly. junction. The suburb of Lent is on the right bank. Industries include brewing and the manufacture of leather and tobacco.

Vaslav Nijinsky,  
Russian dancer

The rly. stn. was severely damaged, and several acres of the town near the station were flattened, in the Allied air attack that preceded the airborne landing (*v.i.*) of Sept., 1944. The great church, dedicated to S. Stephen, a Gothic building, was begun c. 1270, with work of the 14th and 15th centuries. The town hall, in the Renaissance style of the 16th century, restored in 1882, contained a museum of antiquities. There is an R.C. university. Population 103,609.

Nijmegen was known to the Romans as *Noviomagus*, and was a seat of the Carolingian, Franconian, and Hohenstaufen emperors. A free town of the Empire, it joined the Hanseatic League, and in 1579 the union of Utrecht. Held by the Spaniards, 1585-91, it was taken by Turenne in 1672.

In German occupation from May, 1940, Nijmegen was one of three places at which Allied airborne troops were dropped on Sept. 17, 1944, in the attempt to cross the Lower Rhine. Armoured units of the British 2nd army came up, and with the assistance of U.S. parachutists, who crossed the Waal in rubber boats under withering fire, secured the 600-yd. road bridge, Sept. 20, after a fierce 24-hr. battle, in time to remove the enemy's demolition charges. An attempt by German underwater swimmers to blow up both the road and the railway bridges on the night of Sept. 28-29 was frustrated. *See* Arnhem.

**Nijmegen, TREATY OF.** Peace that ended the war between France and a coalition formed by the Empire, Spain, and the Dutch Republic. France and Holland

Nijmegen. Air view of this Netherlands town showing the railway bridge (top), the harbour, and the road bridge over the river Waal

signed on August 11, 1678, and the others later, the final arrangement being made in 1679. France received Franche Comté and the control of Lorraine, and some of the fortresses of the Netherlands, while to her ally, Sweden, were returned territories in Germany taken from her during the war. This treaty marked the height of Louis XIV's power.

**Nijni Novgorod.** This is the old name of the sixth city of Russia, now Gorky (*q.v.*).

**Nijni Tagil.** Industrial town in the Ural Mts., Sverdlovsk prov., R.S.F.S.R. Developed under the Soviet five-year plans, it has rly. workshops, steel, armament, and machine tool factories, and chemical plants. Besides consuming local coal, it imports supplies by rly. from Karaganda and the Kuzbass. It lies about 140 m. E. of Perm. Pop. 159,864.

**Nikē.** In Greek mythology, the goddess of Victory. By the Romans she was called Victoria. She was the daughter of the giant Pallas, and was elevated to Olympus by Zeus because, with her sisters, she was the first to assist him in his battle with the Titans. In art, Nikē is represented as a winged figure with a palm or a wreath, and in Roman times with a shield. She is often represented as guiding the horses of conquering heroes.

**Nikisch, ARTHUR** (1855-1922). Hungarian musician. Born at Szent-Miklos, Oct. 12, 1855, he studied music as a child in Vienna, where he became a violinist in the imperial orchestra until appointed conductor at the Leipzig theatre. He conducted the symphony orchestra at Boston, 1889-93, orchestras at Budapest, Hamburg, and Berlin, and the Gewandhaus concerts at Leipzig. He died Jan. 23, 1922.

**Nikko.** Religious centre of Japan, in Honshu. It is almost due N. and 91 m. by rly. from Tokyo, the terminus of a branch line near the Daiyagawa, an affluent of the Kinugawa. N.E. to S.W. lies the Nikko range with peaks between 5,000 and 8,000 ft. alt. The district is chiefly celebrated for its lovely scenery, the tombs of Shogun emperors, and numerous temples.

**Nikolaev.** Fortress and commercial seaport of Ukraine S.S.R. It is 40 m. N.W. of Kherson and has rly. connexion with Kharkov. Here unite the rivers Ingul and Bug, flowing into the Dnieper estuary. Formerly the headquarters of the Black Sea fleet, Nikolaev has numerous shipyards. Russian troops evacuated it after blowing up docks, Aug. 17, 1941, and it was in German hands until retaken by the 3rd Ukrainian army, March 28, 1944. Population, 167,108.

Nikē. The Winged Victory (Nikē. Apteros), found at Samothrace, now in the Louvre, Paris

**Nikolaistad.** Russian name of the seaport on the W. coast of Finland now called Vasa (*q.v.*) or Vaasa.

**Nikopol.** Town of Ukraine S.S.R. It lies at the S. end of the great bend of the Dniepor, about 160 m. from the mouth, and is a rich source of manganese. Occupied by German forces in Sept., 1941, it was recaptured by the 3rd Ukrainian army, Feb. 8, 1944. By the end of 1946 the manganese mines had been completely restored. Population, prev. 57,841.

**Nikopolis** (Gr., city of victory). Name of several ancient cities, of which the most important were: (1) In Epirus, situated on a strip of land opposite Actium, in the Ambracian gulf. It was founded by Augustus to celebrate his victory over Antony, Sept. 2, 31 B.C., which made him the master of the Roman world. Games were held here every four years in honour of Apollo, to whom a magnificent temple was erected. (2) In Lower Egypt, on the canal leading from Canopus to Alexandria. Also

founded by Augustus, it commemorated the final defeat of Antony and Cleopatra. (3) In lesser Armenia, on the Lycus, built by Pompey in honour of his victory over Mithradates, 65 B.C.

**Nikopolis** or NIKOPOLI. River port of Bulgaria. It is situated on the S. side of the Danube, about 25 m. N.E. of Plevna, with which it is connected by rly., and is linked by ferry with a rly. on the N. side of the river which connects with the Rumanian rly. system. In a fertile country, famous for its wine, Nikopolis has a citadel, an ancient castle, and a Byzantine church. Here the Turks defeated Sigismund of Hungary in 1396, in a battle at which the future Henry IV of England is said to have been present; and the Russians defeated the Turks in 1829. The town was damaged in the 1877 Russo-Turkish War. Pop. 4,963.

**Nile.** River of Africa. Though it was venerated by the Egyptians as the cause of their prosperity, its sources remained unknown until the discoveries of Speke in 1858 and Baker in 1860 revealed its great reservoir-lakes Victoria and Albert. The ancients had little knowledge of the river above Meroë (*q.v.*), and no knowledge of the causes of the annual inundations of the Lower Nile. Herodotus and other writers discuss this problem, without arriving at its solution. Ptolemy later speaks of two streams issuing from two lakes and afterwards uniting into one river, which was joined by the Astapus to form the main course of the Nile. This conception is illustrated in the maps of the 15th and 16th centuries, and until Bruce discovered the source of the Blue Nile, in 1770, little more than this was known of its course.

The Nile leaves the Victoria Nyanza at its N. end, and pouring over Ripon and Owen Falls proceeds through Lake Kioga (Chigoga), thence generally N.W. until it reaches the N. extremity of the Albert Nyanza. This section of the river is known as the Victoria or Somerset Nile, and below Foweira is impeded by a series of rapids culminating in the Murchison Falls, where the river drops 401 ft. in three cascades to the level of the Albert Nyanza. That lake is fed by the river Semliki, which drains the Edward Nyanza and forms, with the Kagera and other rivers flowing into the Victoria Nyanza from the S., the extreme head-waters of the Nile. From the N. extremity of the Albert Nyanza the river, here the Bahr-el-Jebel and later the

Arthur Nikisch, Hungarian musician

Nile. Map of the basin of the river from Lake Victoria Nyanza to the Mediterranean

White Nile, flows generally N. to the Mediterranean. At Refaj, 15 m. S. of Gondokoro, it enters the region of the plains and continues thence to Khartoum, some 1,096 m. to the N. Between these two points the Nile is navigable.

About 480 m. N. of Refaj the Bahr-el-Ghazal enters the Nile from the W., and 50 m. farther is the junction with the Bahr-el-Zeraf. Some 530 m. S. of Khartoum and 31 m. from the Bahr-el-Zeraf the Nile is joined by the Sobat, flowing from the highlands of Abyssinia, and at Khartoum the waters of the Blue Nile mingle with the main river. From that point there are no considerable tributaries with the exception of the Atbara, which flows into the main river 24 m. S. of Berber. In its course through the Nubian Desert the Nile makes two great bends, and from Khartoum as far as Assuan it is dangerous for navigation. Between these two points occur six cataracts.

whole country would be a desert. This Nile flood is an annual phenomenon comparable in regularity with the monsoon. The headwaters of the river receive water from the constant rains of the equatorial areas round the great lakes; this supply passes N. and is subject to great evaporation, and, being regulated by seepage, or percolation, into the swamps near Lake No, arrives in practically a constant volume by the White Nile at Khartoum. The Assuan dam holds back the Blue Nile and Atbara floods.

The three main requisites for production of a crop are suitable soil, an adequate water supply, and good drainage. The silt in the Nile valley may be said to be everywhere suitable, but water has always had to be artificially provided. Three methods were adopted in ancient days to overcome the vagaries in the height of the Nile, in addition to the basin system. The shadoof was invented

The valley cut by the river as far as Khartoum, about 1,500 m from the sea, is very narrow, and in Egypt fairly deep, the escarpment on either side leading to an irregular plateau, 200-300 ft. above the present bed of the river. The delta is considered to lie in an ancient bay of the Mediterranean, now filled in by silt brought down by the river which at one time might have fallen into the sea at Cairo; the river surface then would be 60 to 70 ft. lower than it is today. Silt and sand at Cairo is probably some hundreds of feet deep.

The importance of the Nile to Egypt and the Sudan cannot be overestimated. Without the annual inundations which fertilise the soil and provide the needful water for irrigation, the

to enable water to be lifted by direct manual labour on to fields which would otherwise remain unwatered; the water wheel (sakia) was brought into use with the assistance of oxen; and primitive canals were dug to take advantage of higher water levels upstream. The necessity for drainage depends to a large extent on the crops produced and the intensity of cultivation.

Among engineering works constructed on the Nile, for improving the water supply and for irrigation, may be mentioned:

The Delta barrage (1861), comprising the Damietta and Rosetta branches, cost nearly £2,000,000, and is 1,000 metres in length. In 1902 the Zifta barrage, 400 metres, and the Assiut barrage, 833 metres, were completed, and the Assuan Dam, which cost about £2,500,000, was brought into operation. This last is nearly 2,000 metres long, and in 1907-12 and again later it was thickened, heightened, and strengthened. The Eena barrage, in Qena prov., regulates the water drawn off by the Asfum and Kalabia irrigation canals; it was constructed in 1908 and is being remodelled so as to provide perennial irrigation for 600,000 acres, which will allow of growing two crops a year. The Nag Hammadi barrage, costing nearly £2,000,000, was completed in 1930, is 876 metres long, and waters Girga prov. The Sennar dam, on the Blue Nile, 160 m. S.S.E. of Khartoum, which was built 1921-25 for c. £5,600,000, extends some 3,000 metres and renders fertile 850,000 acres.

The most important places on the Nile are Damietta and Mansura, on the Damietta branch; Cairo, Beni-suef, Assiut, Girga, Qena, Assuan, Korosko, Wadi Halfa, Berber, Atbara, Khartoum, Omdurman, Kodok, and Gondokoro, on the main river. The Nile as far as the Victoria Nyanza is 3,526 m. long. See N.V.; also Assiut; Assuan; Damietta; Egypt; Khartoum; Owen Falls Dam; Sennar Dam.

Lyons, 1906; Discovery of the Source of the Nile, J. H. Speke, new ed. 1906; Egyptian Irrigation, Sir W. Willcocks and J. I. Craig, 3rd ed. 1913; The Nile Basin, H. E. Hurst and R. P. Black, 1945.

**Nile, BATTLE OF THE.** British naval victory, Aug. 1, 1798. The treaty of Campo Formio, Oct. 17,

1797, had practically made the Mediterranean a French lake. Mutiny had weakened the British fleet, and when Spain entered the war, the fleet had been compelled to abandon the Mediterranean. Bonaparte was instructed to seize Malta, drive the English from all their possessions, occupy Egypt, make a channel through the isthmus of Suez, and secure the Red Sea for France. Lord St. Vincent, who was blockading Cadiz, heard of the armament preparing at Toulon, and sent Nelson to look into the ports and observe the proceedings of the French. No proper force could be given to him, and his flagship, the *Vanguard*, was dismasted in a gale which left the French untouched. They put to sea on May 19, took possession of Malta, and were joined by convoys from Genoa, Ajaccio, and Cività Vecchia.

In England it was thought that Bonaparte might aim at Naples or Sicily, or land an army to invade Portugal, or strike at Ireland. Nelson, reinforced, sought the enemy for many weeks, deploring the want of frigates to scout for him. On Aug. 1 he discovered the French transports at Alexandria, and their fleet of 13 sail of the line and 4 frigates, commanded by Brueys, anchored in a broken line, in Abukir Bay. Nominally the French fleet was far superior to his own.

Nelson's plan was to attack the French van and centre, and to anchor, if it might be, inside and outside the French line. If Brueys was not surprised by Nelson's attack, he was unprepared for the English ships going between him and the shore. The Goliath, Zealous, Orion, Theseus, and Audacious all passed inside the enemy's line at about 7 p.m., anchoring, and raking with terrific fire the headmost ships of the squadron—*Guerrier*, *Conquérant*, *Sérieuse*, *Peuple Souverain*, and *Spartiate*. The *Vanguard*, flying Nelson's flag, anchored by the stern outside and abreast of the *Spartiate*, and the *Minotaur* and *Defence* followed. The *Bellerophon*, *Majestic*, *Swiftsure*, and *Alexander* successively attacked the three-decker *Orient*, which flew the French admiral's flag, the first two suffering serious loss. A tremendously destructive fire was poured into the enemy. The headmost ships of the French line were completely overcome, and at about 10 o'clock the *Orient* caught fire, and was soon ablaze. The *Guillaume Tell* and *Généreux* were fugitives. See Egypt; Nelson; Sea Power.

**Nilgai** (*Boselaphus tragocamelus*). Species of antelope, found in India. It stands between 4 ft. and 5 ft. high at the withers. The adult male is brownish grey, with white markings on the face and throat, white rings at the fetlocks, whitish underparts, and short, smooth, nearly straight horns. The females are smaller, brown, and hornless. The animal is remarkable for the comparative shortness of the hind limbs, and the rapid slope of the back line. It is found in the plains and hills of India.

**Nilgiri or NEILGERRY HILLS.** Hill range of the Deccan, India. The Blue Mts., so called from the overhanging haze which characterises the hills when seen from the plains, form a knot of high ground, alt. 6,000 ft., at the junction of the E. and W. Ghats. To the S. the Palghat Gap separates the sharp slopes from the S. continuation on the W. Ghats; to the N. the Wainad tableland stretches to Mysore. The high ground consists almost entirely of open, grassy "downs," separated by forested glades, from which rise the peaks. Dodabetta, 8,760 ft., is the culminating point, while close to it Snowden, Elk Hill, and Club Hill, all higher than 8,000 ft., are on the edge of an amphitheatre within which lies Ootacamund. This elevation modifies the climate, so that the Nilgiris are a hot weather resort for Europeans. Cinchona, jalap, ipecacuanha, and coffee are grown upon numerous plantations. Of the natives the Todas are pastoralists, the Badagas tillers of the soil; primitive Kurumbas and Irulas live in jungles.

**Nilgiris.** District of Madras state, India, comprising almost entirely the area of the Nilgiri Hills. Only about one-tenth of the total area is tilled, chiefly for native food grains and plantation products, coconuts, etc. Its area is 989 sq. m. Pop. 209,709.

**Nilometer.** Instrument or gauge for measuring the annual floods of the Nile. Anciently such instruments were placed all along the river; the oldest existing one was set up in 847 B.C. on the island of Rhoda, near Cairo. It consists of a square well connected with the Nile by a canal and containing a granite pillar marked with 24 lines at intervals of one cubit.

**Nilotic.** Term denoting the E. division of the true negro race. Wholly within British control, they occupy the valleys and marshlands of the upper Nile basin, to which they became confined by the pressure of pastoral tribes of Hamitic stock. Tall, slim, narrow-headed, and the darkest of all negroes, they are distinguishable from the W. or Nigritic division by their more retreating foreheads and

Nilgai. Antelope which is found in the plains and low hills of India  
W. S. Berridge, F.Z.S.

longer legs. Mostly unclothed, they have personal ornaments including metal and ivory armlets, ostrich shell beads, and lip plugs; most tribes also extract the lower incisors. They practise cattle-breeding and agriculture, and subsist largely on milk and fish. Their round huts, with conical or domed roofs, are sometimes supplemented by bachelor-huts on tall posts and by pile granaries. They use clubs, socketed spears, bows, and sometimes wrist-knives, with wood or hide shields.

The principal tribes are the Shilluk, Dinka, Nuer, Acholi, Kavirondo, Jaluo, Bari, Latuka, Lango, Nandi, Suk, and Turkana. Their southernmost representatives, the Masai, exhibit the fullest infusion of Hamitic blood and culture. See Negro.

**Nim** (*Azadirachta indica*). Tree of the family Meliaceae, also called neem, margosa, or bead-tree. A native of India, it has leaves divided into numerous oval leaflets with toothed edges, and branching panicles of small bluish flowers, succeeded by olive-like purple fruits, each containing a single seed. The latter has a natural perforation, which causes it to be used in the construction of rosaries, and on this account Roman Catholics call the tree *Arbor Sancta*. The timber is useful for building, and the bark affords a tonic, whilst the roots are used as a vermifuge and the fresh leaves as a natural poultice for glandular swellings and in rheumatism. Dried leaves inserted between the leaves of books, etc., repel the attacks of destroying insects. The same property resides in the seeds, which are powdered to form an insect-poison, and when dissolved in water may be utilised as a hair-wash. The fruit yields the medicinal margosa oil, which serves also as a dye for cotton goods.

**Nimbus** (Lat., a cloud, divine effulgence). In art, the halo encircling the head of a holy personage. (See Aureole; Halo.)

In meteorology, nimbus means a rain cloud, really dense masses of dark, formless clouds with ragged edges, through which is visible a higher sheet of altostratus. Low fragments of cloud floating below the nimbus are called fractonimbus or scud. Steady rain or snow usually falls from the edges of the nimbus. See Cloud, colour plate.

**Nîmes.** City of France, capital of the dept. of Gard. It is situated in a fertile plain W. of the Rhône

Nîmes arms

and E. of the Cévennes Mts., 25 m. N. of the Mediterranean and 174 m. S. of Lyons. Pop. 104,103. It has Roman remains; other buildings are the cathedral of S. Castor, the churches of S. Baudile and S. Paul, the citadel, dating from the 17th century, and several museums. A former Jesuit college houses one collection and also the public library. The museum of painting and sculpture includes a collection of pictures purchased by the city in 1875. There is a palais de justice. Industries include the manufacture of silk and other textiles, and a trade in wine. The old fortifications have been replaced by boulevards, while another public

notable, and it is said to have held over 20,000 persons. The Maison Carrée is a perfect Roman temple. The Temple of Diana and two Roman gates still remain, but nothing is left of the capitol. The ruined Great Tower, another Roman edifice, stands on Mont Cavalier, 375 ft. high. Just outside are the Pont du Gard, a Roman aqueduct, and the remains of some baths, both built under Agrippa.

Having taken the existing village from the Gauls, the Romans made Nîmes into one of their greatest cities. Augustus, who was mainly responsible for this, built its extensive walls. After the fall of the Roman empire the city suffered decline. In 1185 it became part of the county of Toulouse and was again surrounded with walls. For a short time in the 16th century there was a university here. In the time of the Reformation it was a Protestant stronghold and the scene of considerable bloodshed. Four ecclesiastical councils were held at Nîmes, the most important being the one under the presidency of Pope Urban II in 1096. Alphonse Daudet was one of several eminent men born in the city. In the unoccupied zone of France during the Second Great War until Nov. 1942, it was liberated by French troops under Gen. de Lattre de Tassigny, Aug. 28th, 1948. See Maison Carrée.

**Nimitz, CHESTER WILLIAM** (b. 1885). American sailor. Born at Fredericksburg, Texas, Feb. 24, 1885, he graduated from the U.S. naval academy in 1905. During the First Great War he was chief of staff to the American submarine force in the Atlantic. Promoted rear-admiral, 1938, he took over command of the Pacific fleet after the disaster of Pearl Harbour in 1941, with the rank of admiral; his command included army and

marine units as well as naval ones. Operations against the Japanese in the Solomon, Gilbert, and Marshall Islands and at Iwojima were directed by Nimitz, who

Chester Nimitz, American admiral

in 1944 was promoted fleet admiral. He directed operations against Leyte, Luzon, and Okinawa, and signed the Japanese surrender as U.S. representative, Sept. 2, 1945. Then he became chief of U.S. naval operations, retiring 1947. In 1949 he was appointed U.N. administrator of the Kashmir plebiscite.

**Nimrod.** In the O.T., a son of Cush, and a notable hunter and warrior (Gen. 10). He ruled at Shinar and is regarded as the founder of the Assyrian power. Nimrod was the pen-name of C. J. Apperley (q.v.).

**Nine Pins.** Wooden pieces with which the game of skittles or nine pins is played. The object of the game is to knock the pins over with a wooden ball at the fewest possible attempts. In the U.S.A. the popular game of bowling has developed from nine pins. See Skittles.

**Nine Power Agreement.** Signed in 1923 between Great Britain, France, Italy, Belgium, the Netherlands, Portugal, the U.S.A., Japan, and China. It guaranteed the sovereignty, independence, and administrative and territorial integrity of China, pledging the signatories to assist that country to maintain a stable govt., and ensuring non-discrimination in diplomatic and commercial relations. The treaty was violated by Japan's military action in Manchuria in 1931. After her attack on China in 1937, the treaty was invoked, but a conference at Brussels failed to yield any result. See China; Japan; Manchuria.

amenity is the Fountain Gardens. The city has a service of electric tramways and several theatres.

One of the most ancient and interesting of French cities, Nîmes is famous for its Roman remains. It was founded by Augustus, and an amphitheatre and other features of a typical Roman city were soon erected. The amphitheatre is in an excellent state of preservation. Its vaults, which resemble a natural cavern, are

Nîmes, France. Roman amphitheatre built 1st-2nd century A.D. It contained thirty-four tiers of seats and held 20,000 spectators. Above, left, Maison Carrée, a Roman temple erected about A.D.1

Nineveh. Reconstruction of the palaces on the banks of the Tigris, from plans of the existing remains. The great tower on the left represents the supposed tomb of Sardanapalus; on the right is the palace of Esarhaddon

From Layard's *Monuments of Nineveh* (2nd series), by courtesy of John Murray

**Nineteenth Century and After.** THE. British monthly review. It was established in March, 1877, by James T. Knowles, founder of the Metaphysical Society. Its first issue contained a prefatory sonnet by Tennyson and contributions by Matthew Arnold, Gladstone, Huxley, and Manning. The last two words in the title were added in 1901. The review aims at registering its "disbelief in the contemporary fallacy of collective identity," and 'at an objective and unbiased presentation of home and foreign affairs, arts, and letters. It is edited at 10, Orange St., London, W.C.2.

**Ninety-Eight.** Term used in connexion with the rebellion that broke out in Ireland in 1798. England was at war with France, and there was general unrest. A small rebellion in Ulster was crushed and the whole country placed under martial law. Under this there was a certain amount of terrorism, and in May rebellion broke out in Kildare. Other Leinster counties followed, but the risings were quickly put down. In Wexford, however, the movement was more serious, and 15,000 rebels under Father Murphy seized the county town there and set up a camp on Vinegar Hill. A large body attacked and almost destroyed New Ross, but the insurgents were defeated when they marched to Arklow. On June 21 General Lake attacked their camp on Vinegar Hill, and his complete victory there practically ended the rising. The movement is commemorated in J. K. Ingram's verses, *Who fears to speak of '98?* In the same way the Jacobite risings of 1715 and

1745 are known as the Fifteen and the Forty-five. See Vinegar Hill.

**Nineveh.** Assyrian city on the left Tigris bank opposite Mosul, now in Iraq. Its walls, enclosing 1,800 acres, with 15 gates and many towers, were protected on three sides by a moat filled from the Choser tributary. This crossed the city to the Tigris, once flanking its W. wall for 2½ m., but now separated by a broad crescent of silt. A double earthwork defended the E. wall.

A remote Neolithic settlement, confirmed by obsidian implements from the lowest Kuyunjik stratum, preceded an immigration of metal-using people (Gen. 10) from S. Babylonia, whose fish-goddess Nina gave her name to the city. Worshipped in a temple repaired by Hammurabi, about 2100 B.C., she became identified with Ishtar. A Mitannian domination, about 1400, preceded the outburst of Assyrian conquest under Shalmaneser I, about 1300; he restored the temple, although making Calah his capital. It was made a royal residence by Ashurbelkala, about 1100 B.C.

Nineveh owed its chief renown to Sennacherib (2 Kings 19), who erected a majestic palace at Kuyunjik and an arsenal at Nebi Yunus, the traditional tomb of the prophet Jonah. Besides canalising the city, he laid out a park wherein he acclimatised exotic animals and plants, including the Arabian cotton. Esarhaddon widened the streets and built a palace at Nebi Yunus. In Ashurbanipal's palace, N. of Sennacherib's, Rassam found, 1854, an immense cuneiform library, now in the British

Museum. The fall of the city, foretold by Nahum and Zephaniah, was achieved by the Median Cyaxares and the Babylonian Nabopolassar, 606. Its memory was already effaced when Xenophon traversed its ruins, 401 B.C., and a Sassanian village grew upon the mounds. See Babylonia; Kuyunjik; Mesopotamia. Consult Discoveries in the Ruins of Nineveh and Babylon, Austen Layard, 1853.

**Ningpo.** City in Chekiang prov., China. It is situated at the junction of the two branches of the river Yung, 12 m. from the mouth. Ningpo is 1,200 years old; the site of old Ningpo, which is said to have existed 2205 B.C., is at some distance from the present city. The circuit of the walls, built about 870, is 5 m. Portuguese traders visited Ningpo in 1522, but were expelled in 1542. The city was occupied by the British, 1841, and declared a treaty port by the treaty of Nanking in 1842. A British consulate was established here in Dec., 1843, and a customs station in 1861. Pop. 218,774.

**Ningsia** or NINGSIA. Province of N.W. China. It contains 13 counties with Ningsia city as capital. There is no railway and only a few highways. River junks connect it with neighbouring provinces. Around Ningsia city is a network of canals, which provides water for a number of small farms. The chief products are wheat, wool, and livestock. The N.W. region is inhabited by nomadic Mongolian-speaking Khalkas and Buriats. The Alashan range runs through the centre of the province. Area 106,143 sq. m. Population 724,000.

**Ninian** OR NINIAS (d. c. 432). British bishop and saint. A native of N. Wales, he was educated in Rome, and being consecrated bishop, built what is said to have been the first stone church in Britain at Whithorn, in Galloway. A missionary among the southern Picts, he is credited with maintaining the Catholic faith against the teaching of Pelagius. His festival is Sept. 16.

**Ninib.** Babylonian and Assyrian deity. Appropriating the attributes of Ningirsu of Lagash and other vegetation gods, he was, as son of Enlil (Bel), deemed to represent the beneficent vernal sun, in contradistinction to Nergal, representing the destructive summer heat. Ashurnatsirpal invoked him as the god of battles.

**Ninnis Glacier.** Ice field on the coast of King George V Land, Antarctica. It is about 50 m. E. of the similar but smaller Mertz glacier. It was discovered by the Mawson expedition (1911-14) and named after Lieut. Edward Ninnis, a member of the expedition who met his death there.

**Niobē.** In Greek mythology, the wife of Amphion, king of Thebes, by whom she had twelve children. She was so proud of this that she mocked the goddess Leto or Latona, who had only given birth to two children, whereupon the offended goddess incited her son Apollo and her daughter Artemis to slay all the children of Niobē with their arrows. Niobē was changed into a stone, in which form she incessantly wept for her lost children, streams of water trickling down the stone. The legend of Niobē has frequently been treated in art. The group of Niobē at Florence is a copy of one which is attributed to Scopas or Praxiteles.

Niobē, with one of her daughters: copy of sculpture attributed to Scopas or Praxiteles. Uffizi Gallery, Florence

See Magnesia.  
**Niobium** OR COLUMBUM. One of the less known metallic elements, the properties of which indicate that it may in future have applications in metallurgy. Its chemical symbol is Nb or Cb, and it is one of the transitional elements in the second long period of the periodic table of the elements. Its atomic number is 41; atomic weight,

92.91; specific gravity, 8.4; melting point, 1,950° C.; crystal form, body-centred cubic, with lattice constant  $a = 3.2941$  and an interatomic distance of 2.8528 Å.

It occurs in nature chiefly as columbite,  $(\text{FeMn})\text{Cb}_2\text{O}_6$ , and it is often associated with tantalite,  $(\text{FeMn})\text{Ta}_2\text{O}_6$ . It is obtained chiefly from deposits in N. Nigeria and from S. Dakota. The metal was first separated in 1846 and it is now extracted with tantalum by fusion with caustic potash.

Metallic niobium is light steel-grey in colour and similar to wrought iron in mechanical properties, being easily fabricated and welded. Being resistant to corrosion and attack by acids, it has been used for chemical apparatus. The metal readily absorbs gases and has been used as a "getter" in thermionic valves. It is available as wire, sheet, and rod, and the ferro-alloy is added to steels, in which it forms stable carbides. See Getter; Metallurgy; Nitriding; Tantalum.

**Niobrara.** River of the U.S.A. Rising in the S.E. of Wyoming, it flows E. through Nebraska, and joins the Missouri on the right bank at Niobrara. It is a rapid, unnavigable river 450 m. long.

**Niort.** City of France. It stands on the left bank of the Sèvre Niortaise, 38 m. N.E. of La Rochelle, in the dept. of Deux Sèvres, of which it is the capital. Its buildings include the beautiful church of Notre Dame, built in the 16th century. The churches of S. Andrew and S. Hilary are modern. The keep of the castle still stands, and there is a fine modern town hall, and a palais de justice. The old town hall houses a museum, and there is a botanical garden.

The industries include tanning and the making of gloves and boots, while there are many market gardens in the vicinity. Niort grew up around a castle built by the count of Anjou, in the 12th century, and was a flourishing port. During the wars of religion it was a Huguenot centre, and was besieged; in 1588 the cathedral of S. Andrew was destroyed. Pop. 32,752.

**Nipigon.** Lake and river of Ontario, Canada. About 30 m. N. of Thunder Bay on Lake Superior, it is 70 m. long and 40 m. broad; area 1,730 sq. m. In it are about 1,000 islands, and the Ogoki flows into it from the N. The river Nipigon passes from the lake into L. Superior, and is famed for its trout.

**Nipissing.** Lake of Ontario, Canada. It lies N. of Lake Huron, is 50 m. long and about 20 m. broad; area 330 sq. m. The Sturgeon flows into it and the French River, 55 m. long, carries its waters to Lake Huron. It contains many islands. The part of Ontario around it is known as the Nipissing dist.

**Nippon.** Variant spelling for Nihon, or Dai Nihon, the Japanese name for Japan (*q.v.*).

**Nippur.** Sumerian city at Nuffar on the Shatt-en-Nil, 20 m. E.N.E. of Diwaniya, central Babylonia. Its identification with Calneh (Gen. 10), and that of Ezekiel's river Chebar with the Nil canal, are tentative. It was examined by Layard 1851, and excavations by Peters, Haynes, and Hilprecht, 1889-1900, revealed a continuous history from reed-huts on Neolithic marshes to palaces of Parthian kings. A centre of religion and learning, its Enlil temple, restored intermittently, from Naramsin to Ashurbanipal, ultimately became a Seleucid fortress. Its yield of clay tablets included 40,000 temple records and 730 business documents of brokers and bankers of Persian kings of the 5th cent. B.C. See Deluge Legends; Parthia.

**Nirvāna** (Skt., extinction). Buddhist term for the spiritual state attained by one who has conquered self and, by the exercise of self-sacrifice, sympathy, loving thought, and deeds of kindness, extinguished desire. The attainment of Nirvāna implies the extinction of personality and the union of the individual with the infinite. See Karma.

**Nisan.** First month in the Jewish eccles. year and seventh in the civil or secular. It corresponds approximately to the Christian month of April. The name Nisan was adopted from the Babylonian calendar after the Captivity (Neh. 2, v. 1) and replaced the Jewish name of Abib (*q.v.*).

**Nish** OR NIS. Town of Yugoslavia. The ancient Naissus, it is the chief city in Upper Moesia or Morava. It stands on the Nisava, is the junction of the rly. from Belgrade, 180 m. N.W., to Sofia with the line to Salonica, and has extensive rly. works. It was the birthplace of Constantine the

**Nissen Hut.** Invented for the housing of armed forces, these huts at Brixton, London, were erected during the Second Great War to accommodate bombed out families

Great. On the outbreak of the First Great War, the Serbians made it their temporary capital. It was taken by the Bulgarians Nov. 5, 1915, but recaptured by the Serbs Oct. 12, 1918. In the Second Great War it was occupied by German forces, April 9, 1941, and liberated Oct. 16, 1944, by Bulgarians with Russian troops and Yugoslav patrols. Pop. 35,465.

**Nishapur.** Town of Persia, famous as the birthplace and burial place of Omar Khayyám (*q.v.*). It is in the prov. of Khorassan, about 50 m. W. of Meshed, and trades in cotton and woollen goods and fruits, chiefly almonds. Some 30 m. N. of it are turquoise mines.

**Nisibis.** Ancient city of Mesopotamia, also called Antiochia Mygdoniae. It is the modern Nisibin on the boundary between Syria and Turkey. It changed hands several times in many wars between Romans and Parthians and Persians, but finally passed to the last, after the disastrous expedition of Julian the Apostate, 363. Nisibin was included by the Turks in the vilayet of Diarbekir.

**Nisi Prius** (Lat., unless before). English legal term. By Magna Carta, it was ordered that certain writs of assize should be tried before justices who should be sent into every county at least once a year. At a very early date it became customary to try other actions before the judges of assize. Jurors used to be summoned, by writ of venire, to the courts at Westminster on such and such a day, unless before that day the king's justices should come into their county. A trial of a civil cause before a judge of assize was therefore called a trial at *nisi prius*; and the term is still adhered to, and recognized by statute.

**Nissen Hut.** Building used by the British armed forces. It consists of two corrugated iron struc-

tures of semi-circular section erected one within the other on a metal frame, with a small air space in between. The floor above the brick foundation is of wood, as are the end walls, in which doors and windows are built. Dormer windows are sometimes built into the side walls. The length is from 16 ft.

upwards. The hut, self-supporting and weatherproof, was invented in 1915 by Col. Peter Nissen, R.E., to meet an urgent need for shelter. Among its advantages are the rapidity with which it can be erected or dismantled, and the ease with which it can be transported; six men can put up a Nissen hut in one day. The principle of construction was later applied to factory buildings.

**Nith.** River of Scotland. Rising in Ayrshire, it flows 55 m. S.E. through Dumfriesshire to the Solway Firth, 13 m. below Dumfries. Its valley is known as Nithsdale.

**Nithsdale, WILLIAM MAXWELL, 5TH EARL OF (1676-1744).** Scottish Jacobite leader. Son of Robert, 4th earl, in 1715 he joined Derwentwater in the rebellion, and with other Jacobite leaders was captured at Preston and sentenced to death. Nithsdale was saved by his wife, who, after pleading vainly with the king, paid a farewell visit to her husband in the Tower, disguised him as a woman in hood and cloak, and got him safely away. Nithsdale escaped to Calais. His wife was arrested, but later was permitted to join him. His estates were forfeited, but restored to his son on the earl's death, March 20, 1744. The title was forfeited.

**Niton.** Alternative name for the gaseous element, no. 86 in the periodic table sometimes called radon. See Radium; Radon.

**Nitrates.** Name given to the salts or compounds of nitric acid, *i.e.* those formed by the substitution of metals for the hydrogen of nitric acid (*q.v.*). Nitrates find useful applications, *e.g.* the potassium salt ( $\text{KNO}_3$ ) in the manufacture of gunpowder, glass, enamels, pyrotechnics, and fertilisers; ammonium nitrate ( $\text{NH}_4\text{NO}_3$ ) in freezing mixtures, explosives, and fertilisers; and calcium nitrate,  $\text{Ca}(\text{NO}_3)_2$ , as a fertiliser.

Potassium nitrate (nitre or saltpetre) has been used since ancient times. It is found in Bengal, Bombay, and in caves in Ceylon formerly tenanted by men, animals, and bats, and as an efflorescence on soils in hot countries such as Peru, Bolivia, S. Africa, and Egypt. Up to the beginning of the 19th century it was made in Europe from artificial saltpetre earth by stacking decomposing organic matter in mounds and moistening from time to time. The nitrification process was allowed to proceed for about a year before the mounds were extracted with water and the dissolved nitre obtained by evaporation. Saltpetre is extracted in India from natural saltpetre earth by lixiviating in wooden or earthenware vessels and concentrating in iron pots; the crude product contains 45-70 p.c. of potassium nitrate. Saltpetre, or conversion nitrate, is also made from sodium nitrate and potassium chloride by mixing a saturated solution of the former salt with a molecular proportion of potassium chloride and concentrating. Nearly pure potassium nitrate is deposited on cooling.

Another mineral of economic importance is nitratine (sodium nitrate), which before 1900 supplied the bulk of the world's nitrogen requirements. Since then the extraction of nitrogen from coal and the atmosphere, and the direct synthesis of ammonia from nitrogen and hydrogen have furnished 92 p.c. of the world's production. In the Chilean desert regions, nitratine deposits occur among other soluble alkali salts. Because of their solubility, such minerals can accumulate only in extremely arid regions and the association of the Chilean deposits with volcanic rocks suggests that the nitrates have been derived from the latter by some leaching process. Chilean saltpetre is mostly used as a fertiliser.

**Nitrator.** Chemical apparatus in which the operation of nitration is conducted. The essential features are a container usually constructed of iron or lead, but sometimes of earthenware, fitted with means for heating or cooling the contents, either by a jacket or internal coils for steam or water circulation; pipes for the admission of raw materials and acids; provision for the removal of fumes, and means of agitating the contents. For nitroglycerine a lead vessel is generally used, and because of the sensitive nature of the explosive compressed air is injected for agitation. A drowning

pit is also arranged below, into which the contents may be quickly dumped if any dangerous action commences. Nitro-aromatic compounds are dealt with in large iron nitrators fitted with mechanical agitators. These frequently have a capacity of 1,600 gallons, producing about 4 tons of explosive at each operation. See Explosives.

**Nitre-cake.** By-product in the manufacture of nitric acid from sodium nitrate and sulphuric acid. Chemically it is known as acid sodium sulphate or bisulphate of soda ( $\text{NaHSO}_4$ ). Nitre-cake is used as an acid flux in the decomposition of minerals and in dyeing.

**Nitric Acid** or **Aqua Fortis** ( $\text{HNO}_3$ ). One of the oldest known nitrogen compounds, containing that element with hydrogen and oxygen. It is still manufactured by decomposing Chile saltpetre (sodium nitrate) with sulphuric acid, a method closely resembling those employed in the 16th century for the production of aqua fortis for parting gold and silver. A modern process is the catalytic oxidation of ammonia by passing it mixed with air over heated platinum gauze. Another method is bringing about the direct union of oxygen and nitrogen by the electric arc (Birkeland-Eyde process). Nitrogen peroxide is the chief gas formed, and this, absorbed by water, yields nitric and nitrous acids, the latter being subsequently converted into nitric acid.

Nitric acid is largely used for the manufacture of explosives—nitroglycerine, gun-cotton, trinitrotoluene, etc.—and aniline dyes. It forms a series of salts known as nitrates, some of which are largely employed in industries. Silver nitrate is valuable in photography, lead nitrate, iron nitrate, and aluminium nitrate in dyeing and calico-printing, and barium and strontium nitrates in fireworks.

**POISONING BY NITRIC ACID.** Two drachms of concentrated nitric acid have proved fatal. As soon as the acid is taken, violent pain is felt in the mouth, gullet, and stomach, followed by severe vomiting. The lips and teeth are stained yellow, and the mucous membrane is excoriated. The tongue becomes swollen, symptoms of collapse supervene, the pulse becomes weak, the skin cold and clammy. Eventually death occurs from exhaustion, usually in from 18 to 24 hours. If death does not occur from shock, bronchitis, congestion of the lungs, and pneumonia may follow. Inhalation of the fumes alone may be fatal. Treatment

should be directed to neutralising the acid as quickly as possible. Calcedined magnesia is the best antidote, but sodium bicarbonate, chalk, whitening, ceiling plaster, etc., may be administered.

**Nitriding.** A process of case-hardening (*q.v.*), used to produce a thin but hard case on finished steel articles. The steel part is finished by machining and heat-treated to give the properties desired for the core. It is heated for 40–90 hours at  $500^\circ \text{C}$ . in a box through which ammonia is circulated, and then cooled slowly in the same box. Part of the ammonia breaks up into nitrogen and hydrogen, and some of the nitrogen is absorbed in the surface of the steel, forming iron nitride,  $\text{Fe}_3\text{N}$ . Plain carbon steels can be treated in this way, but better results are obtained with alloy steels containing small amounts of chromium, molybdenum, or aluminium. The process gives a case extremely hard but needing no subsequent heat-treatment. It is used for spindles, gears, and valves. See Carbo-nitriding; Carburising.

**Nitrification.** The conversion of nitrogen existing as organic matter or ammonium compounds into nitric acid, and then by combination with a base into nitrates. This is effected by micro-organisms. In soils it is particularly important, since only in the form of nitrates do most plants absorb the nitrogen they require. It takes place in three stages: first, the conversion of organic nitrogen into ammonia by the action of moulds and the organism *Bacillus mycoides*; second, the conversion of ammonia into nitrites largely by the action of the organisms *Nitrosomonas* and *Nitroso-coccus*; finally, the conversion of nitrites into nitrates, mainly by the action of the organism *Nitro-bacter*.

Essential conditions are (1) suitable food such as potash, lime, sulphates, phosphates, carbon dioxide; (2) a base with which nitrous and nitric acid may combine; (3) suitable temperature, about  $0^\circ$  to  $55^\circ \text{C}$ .; (4) sufficient moisture; (5) absence of strong light; (6) enough oxygen: nitrification does not proceed in waterlogged soil. Potassium carbonate accelerates nitrification in soils rich in humus. Where there is a deficiency of oxygen, a further series of micro-organisms brings about the liberation of free nitrogen from nitrates in soils and manure heaps; this process is termed denitrification.

**Nitro-Benzene.** Yellow liquid with characteristic odour resembling oil of almonds and sometimes used as a cheap substitute in perfumery, etc. It is sometimes called oil of myrbane. An important raw material for dye manufacture, it can be converted to aniline. See Aniline Dyes.

**Nitrocellulose.** Term used to designate the esters of cellulose. These are more properly termed the cellulose nitrates, and are made by treating bleached cotton linters with a mixture of sulphuric acid, nitric acid, and water. The product is characterised by its nitrogen content, which falls into three main grades, that with 10.8 p.c. being used in the manufacture of celluloid, that with 11.9–12.2 p.c. (collodion cotton) for production of films and lacquers, and that with 13 p.c. (gun cotton) for explosives. Celluloid, the pioneer plastic of the 1860's, continued to hold its place in world markets, and nitrocellulose lacquers have maintained their popularity as decorative finishes in spite of advances in other synthetic products.

**Nitro-Compounds.** In chemistry, hydrocarbon derivatives containing  $\text{NO}_2$  groups. They are made by the action of nitric acid upon hydrocarbon, and the process applied to the benzene series is known as nitration, examples of the products being nitrobenzene and nitro-toluene. Nitroglycerine and nitrocellulose are well-known explosives formed by the action of nitric acid on glycerine and cellulose respectively. Trinitrophenol or picric acid, and trinitrotoluene are made by the action of nitric acid on phenol and toluene, and are also explosives.

**Nitrogen.** One of the gaseous elements. Its chemical symbol is N.; atomic weight, 14.008. It was discovered in 1772 by Rutherford, professor of botany in the university of Edinburgh. Lavoisier shortly afterwards proved the existence of nitrogen in the air, and called it azote, a name by which it is still known in France. Chaptal, in 1790, first suggested the word nitrogen because he discovered it in nitre or saltpetre.

Nitrogen occurs in the free state in the atmosphere, of which it constitutes about four-fifths. The element also occurs in a combined state as saltpetre and Chile nitre, and as an essential constituent of animal and vegetable organisms. Animals have no power of directly absorbing the nitrogen of the atmosphere, but are dependent on

nitrogenous foodstuffs for their supply of this element. The nitrogenous materials are built up by plants which obtain their nitrogen from the soil, and the object of manuring the land with ammonium sulphate and Chile salt-petre is to replace the nitrogen extracted from it by plants. Natural sources of nitrates found in the soil are the combination of oxygen and nitrogen which takes place during thunderstorms. The quantity so supplied amounts

large proportion of the nitrogen used in industry. The specific gravity of pure nitrogen is 0.96737. The element is incombustible, and does not support combustion. It is also distinguished by its inactivity, although a form of "active" nitrogen, i.e. nitrogen in the atomic form, was discovered by R. J. Strutt (Lord Rayleigh) in 1911.

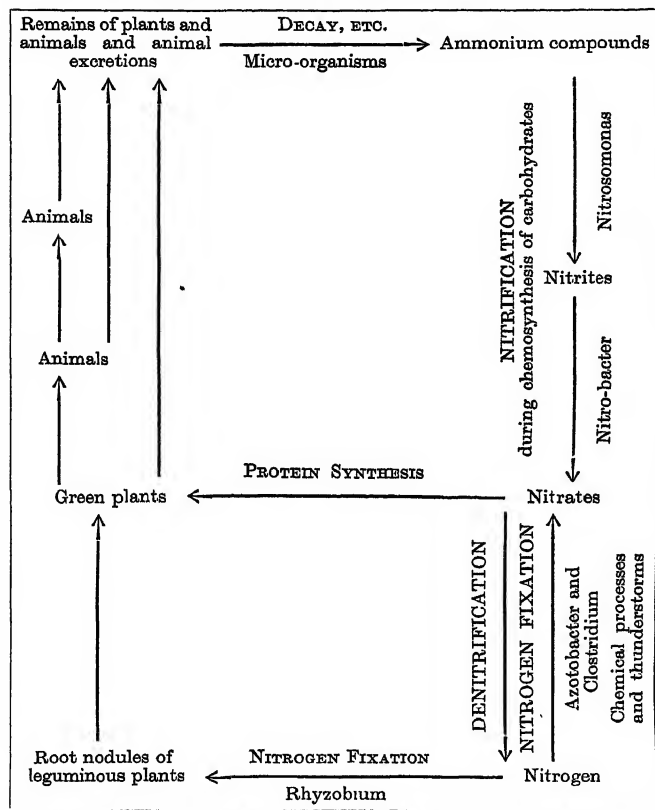

The compounds of nitrogen and hydrogen are ammonia ( $\text{NH}_3$ ), which can be prepared by the direct

being first observed by Davy. It was this effect which gave to it the name of laughing gas. Nitrous oxide is employed as an anaesthetic in dentistry and other surgical operations which require only a short period of unconsciousness. It is prepared by gently heating dried ammonium nitrate, which splits up into nitrous oxide and water. When required as an anaesthetic it needs further purification. It was liquefied by Faraday in 1823.

Nitrogen dioxide was first prepared by van Helmont. It is best made by dissolving copper foil in nitric acid and collecting the gas in a pneumatic trough. Nitrogen trioxide is a red gas made by acting on starch with nitric acid. It forms with water the unstable nitrous acid, which, however, combined as nitrites, forms stable bodies. See Air; Atmosphere.

**Nitrogen Cycle.** Term applied to the series of phenomena, chiefly biological, during which the limited quantity of nitrogen is made to serve successively the needs of diverse organisms all requiring nitrogenous substances for building up the proteins of their protoplasm. Animals and parasitic and saprophytic plants acquire organic nitrogenous materials directly or indirectly from green plants, while these absorb inorganic compounds of nitrogen mainly. The result is a drift from the inorganic to the organic condition, with a tendency for the accumulation of nitrogen in the dead remains of plants and animals. That this tendency is not fulfilled to the detriment of green plants is largely due to the activities of micro-organisms in the soil, which liberate inorganic compounds of nitrogen. This normally inert gas is, however, drawn into the cycle again by the agency of other micro-organisms, by chemical processes of nitrogen fixation; and to some extent by electrical disturbances during thunderstorms.

**Nitroglycerine.** The most important of the various substances used in the manufacture of blasting explosives and propellants. The name has been adopted in all countries, although the correct chemical designation is the trinitrate of glycerine. Nitroglycerine was discovered in 1846 by Ascanio Sobrero, an Italian chemist. It was not until 1859 that Alfred Nobel realized the possibilities of its use as an explosive, and in 1862 he erected a factory for its manufacture at Heleneberg, near Stockholm. Acci-

Nitrogen Cycle. Diagram of the salient features of the circulation of nitrogen

each year to about 11 lb. of combined nitrogen per acre.

Nitrogen is prepared artificially by exhausting the oxygen from a confined space of air and so leaving impure nitrogen behind. This is conveniently done by exposing phosphorus in a bell-jar of air over a trough of water. Chemical methods are also employed, as heating together potassium nitrite and ammonium chloride, or passing chlorine into ammonia. Nitrogen is also obtained from the atmosphere by physical methods, one of these, the fractional distillation of liquid air furnishing a

union of the elements; hydrazine or diamide ( $\text{N}_2\text{H}_4$ ); and azoimide or hydrazoic acid ( $\text{N}_3\text{H}$ ). Nitrogen compounds with the haloid elements also occur, nitrogen chloride and iodide being very explosive.

There are five oxides of nitrogen: (1) Nitrous oxide, nitrogen monoxide, or laughing gas ( $\text{N}_2\text{O}$ ); (2) Nitrogen dioxide, peroxide, or tetroxide ( $\text{N}_2\text{O}_4$ ) ( $\text{NO}_2$ ); (3) nitrogen trioxide ( $\text{N}_2\text{O}_3$ ); (4) nitrogen hexoxide ( $\text{N}_2\text{O}_6$ ); (5) nitrogen pentoxide ( $\text{N}_2\text{O}_5$ ).

Nitrogen monoxide was discovered by Priestley in 1772, its exhilarating effects when inhaled

dents in manufacture caused many difficulties, and, although these were gradually overcome, the use of the oil was inconvenient and dangerous. A great advance was made when Nobel, who had been making continuous efforts to increase the safety of the oil during use and transport, discovered that it was absorbed by the siliceous earth, kieselguhr. For further details of this process see *Dynamite*; *Explosives*.

The new explosive was thus securely established, and its use in Europe and America increased rapidly. Nevertheless, it suffered two defects, (a) in wet conditions water displaced the nitroglycerine, and (b) the use of an inert absorbent decreased the explosive effect. Nobel, however, found that by adding collodion to nitroglycerine the plastic and elastic mass formed could be moulded into cartridges which were comparatively safe to handle, and could be used under water and had a very high explosive effect. The process has been termed "gelatinisation." The nitroglycerine blasting explosives used today are all essentially based upon Nobel's discoveries. The two important advances made since his day have been the development of low freezing and ammonium nitrate explosives.

Nitroglycerine is made from glycerine, a by-product from the manufacture of soaps from oils and fats, by nitration with a mixed nitric and sulphuric acid. During the war, a continuous manufacturing process was operated in this country. The glycerine flows in at the top and the mixed acids at the bottom of a cylindrical vessel, and is circulated by a rotating stirrer. The nitroglycerine-acid mixture is removed continuously through an overflow pipe and passes horizontally to a separator.

Pure nitroglycerine is a yellow oil, of density 1.6, and freezes at 13° C. Its rate of detonation in the open is about 1,600 metres/sec., but when confined, or when initiated by a powerful detonator, it detonates at a much higher rate of about 7,200 metres/sec. See *Explosives*; *Blasting Gelatine*.

**Nitronaphthalenes.** Nitro derivatives of naphthalene first prepared by Laurent, in 1835, by nitrating naphthalene under suitable conditions. The most important is alpha-nitronaphthalene ( $C_{10}H_7NO_2$ ), prepared on a small scale by dissolving naphthalene in glacial acetic acid, adding strong

nitric acid, and heating for half an hour. On a commercial scale a mixture of sulphuric acid and nitric acid is employed. Nitronaphthalene is a solid which crystallises in long lustrous yellow needles, insoluble in water, but readily soluble in benzene, ether, carbon bisulphide, and hot alcohol. Nitronaphthalenes render nitroglycerine non-sensitive to concussion, and when present in small quantities have the important property of preventing dynamite from freezing. The main use of the alpha compound is as an intermediate in the manufacture of dyes.

**Nitrous Ether.** This liquid, under its chemical name, ethyl nitrate, is mentioned under *Ethyl*.

**Nitrous Oxide** or **LAUGHING GAS.** The only inorganic gas which is serviceable as an anaesthetic agent. The gas was discovered by Priestley in 1772, but was first brought to general notice in 1800 by Sir Humphry Davy who discovered and made known the exhilarating properties which earned for it the name of laughing gas. It is colourless, heavier than air, and has a faint sweet smell. Nitrous oxide is probably the safest general anaesthetic known; anaesthesia develops rapidly, but is not deep unless high concentrations are used. The gas has proved of great value in dentistry. See *Anaesthesia*; *Nitrogen*.

**Niue** or **SAVAGE ISLAND.** Pacific island, a dependency of New Zealand. It was named by its discoverer, Capt. Cook, 1774. It is 350 m. S.E. of Samoa, and consists of upheaved coral arranged in two terraces 90 and 220 ft. above mean sea level respectively.

The native villages are all on the lower terrace. Banana and coconut are exported. Alofi is the chief village. The area is 100 sq. m. Pop. 4,271.

**Nivation.** In geology, the action of ice and snow on the land surface near and around an ice-sheet. The action includes frost shattering and removal of the broken debris by rain-wash or wind; and solifluxion (*q.v.*) which is the flow of surface soil as sludge when the snow melts but the melt water is unable to soak away because the ground below is still frozen. See *Coombe Rock*; *Glacier*; *Ice Age*.

**Nive.** River of Spain and France. It rises in N. Spain, and flowing through the Pyrenees joins the Adour at Bayonne; its length is 45 m. In the Peninsular War there were engagements along this

river Dec. 10-13, 1813. On Soult's retreat into Bayonne, after his defeat on the Nivelle, Nov. 10, 1813, Wellington placed his forces on either side of the river Nive. Soult made a sortie, Dec. 10, and launched a heavy attack against a portion of the British forces under Gen. Hope, but was held at bay. Engagements took place on the following days until Dec. 13, when Soult hurled a force of 35,000 men against Hill's body of 17,000. Wellington's timely arrival saved Hill, and Soult withdrew with heavy losses. See *Peninsular War*.

**Nivelle,** ROBERT GEORGES (1856-1924). A French general. Born at Tulle, Oct. 15, 1856,

R. G. Nivelle,  
French general

joined the French army in 1878. On the outbreak of the First Great War in command of an artillery regiment, he was successively promoted brigadier-general and general of division. Placed at the head of the 2nd army, he played a great part in the battle of Verdun, being, as the result of his success, chosen to succeed Joffre; and on Dec. 12, 1916, he was appointed c.-in-c. of the armies of the N. and the N.E. In April, 1917, he planned and conducted a powerful offensive in the Craonne-Reims area; but the losses were so heavy as to discount utterly the small gains made. The French govt. called off the offensive and Nivelle was superseded by Pétain. In Dec., 1917, he was appointed c.-in-c., N. Africa. Retiring in 1921, he died March 23, 1924. See *Aisne Battles*; *Verdun*.

**Nivelles** (Flemish, Nyvel). A town of Belgium, in the prov. of Brabant. It lies 18½ m. by rly. S. of Brussels, on the Thines, is a rly. junction, and has metal works, paper manufactures, and tobacco and furniture industries. The Romanesque church of S. Gertrude was founded in the 11th century. Pop. 12,500.

**Niven,** DAVID (b. 1909). British film actor. The son of Gen. W. G. Niven, he was born at Kiriemuir, Angus March 1, 1909, and educated at Stowe and Sandhurst. After adopting a military career for some years,

David Niven,  
British film actor

he went to the U.S.A. and appeared in M.G.M. films. He came to the fore as Edgar Linton in *Wuthering Heights*, 1939. During the Second Great War he was in such outstanding British pictures as *The First of the Few* and *The Way Ahead*, and then starred in *A Matter of Life and Death*, 1946, also in the British film *Bonny Prince Charlie*, 1948.

**Niven**, **FREDERICK JOHN** (1878-1944). British author. Born at Valparaiso, March 31, 1878, he was educated in Glasgow at Hutcheson's grammar school and the school of art. Beginning with an adventure story, *The Lost Cabin Mine*, 1908, he published books on travel, poems, and novels, including *Justice of the Peace*, 1914, which later gained him an American reputation. One of his best-known stories was *Mrs. Barry*, 1933, describing the life of a Glasgow tenement landlady. He lived much in British Columbia and travelled widely throughout the New World, recording some of his journeys in *Coloured Spectacles*, 1938. Niven died at Vancouver, Jan. 30, 1944.

**Nivernais**. Province of France, represented since 1792 by the dept. of Nièvre (*q.v.*) and part of Yonne. It lay contiguous with Berry, Orléanais, Burgundy, and Bourbonnais, and became a county in the late 9th century. Otto William of Burgundy being its first hereditary count. Held by the rulers of Flanders, 1280-1384, it passed to Burgundy and then to Cleves. A duchy from 1538, it was held by the Gonzague family from 1562 until bought by Mazarin, 1659, and given by him to his nephew, Jules Philippe Mancini. Its capital was Nevers. The Nivernais canal (109 m.), constructed 1784-1842, joins the rivers Loire and Yonne, passing from Decize to Auxerre.

**Nivôse**. Fourth month of the year as rearranged during the French Revolution. It began on Dec. 21 or 22, and the word means the month of snow.

**Nixie**, **NIX**, or **NICK**. Water sprite in the folklore of the peoples of N. Europe. The name occurs in various forms in German, Danish, Swedish, Icelandic, and English legend. It was often regarded as malignant, and its appearance presaged shipwreck and drowning. In its Anglo-Saxon form, *nicor*, it is mentioned in *Beowulf*, where several are slain by the hero. It has survived as one of the names used for the devil, Old Nick.

**Nizam** (Arab., administration). Title of the sovereign of the Indian

Noailles. Members of the French family. Left to right: Anne Jules, 1650-1708; Louis Antoine, 1651-1729; Adrien Maurice, 1678-1786

state of Hyderabad (*q.v.*). The first holder was Asaf Jah (d. 1748), who was styled *Nizam-ul-Mul* (administrator of the kingdom).

**Njörðr** or **Njörðr**. In Norse mythology, the god of the sea, and of seafaring and wealth. One of the race of the Vanir, he is husband of Skadhi and father of Freyr and Freyja. In the war with the Aesir he becomes a hostage. The German Hertha is his female counterpart.

**N.K.V.D.** Former name of the political police of the U.S.S.R., called successively Cheka, OGPU, N.K.V.D., and M.V.D. See OGPU.

**Noah**. O.T. patriarch. Son of Lamech and father of Shem, Ham, and Japheth, by divine command he made an ark in which he and his family were preserved during the Deluge (*q.v.*). The invention of wine is attributed to him (Gen. 6-9).

**Noah**, **THE BOOK OF**. One of the non-canonical O.T. Apocrypha or Pseudepigrapha (*s.e.* works written under an assumed name). It has not been preserved as an independent work, but fragments of it are incorporated in the Ethiopic Book of Enoch, and it is referred to in the Book of Jubilees (10, v. 13, and 21, v. 10). The work, which gives an account of the laws made by Noah for his children, would seem to have been written between 200 and 161 B.C.

**Noailles**. Name of a noble French family. Originating at the château of this name near Brive, Corrèze, the family gave its name to the town of Noailles, Oise, formerly called Longvillers. Antoine de Noailles (1504-62) was chamberlain to Francis I, admiral of Guienne, and ambassador to England, 1533-36; his brother François (1519-85), was bishop of Aix and ambassador to Venice, 1557, and to Constantinople, 1572. Anne Jules, duke of Noailles (1650-1708), a distinguished soldier, repressed Protestants in Languedoc, 1681, and was made marshal in 1693. Louis Antoine (1651-1729) was archbishop of Paris, 1695, and cardinal, 1700, and an opponent of the Quietists.

Adrien Maurice, 3rd duke (1678-1766), served in the wars of Louis

XV, and was an able general, finance president in 1715 and marshal of France, 1734, but was defeated at Dettingen, 1743. Louis, 4th duke (1713-93), was made marshal in 1775. His brother Philippe (1715-94), duke of Mouchy, an able soldier, also made marshal 1775, was guillotined with his wife, Jean François Paul, 5th duke (1739-1824), was a chemist, and his brother Emmanuel Marie Louis (1743-1822) a distinguished diplomat. Paul, 6th duke (1802-85), was an historian; Jules, 7th duke (1826-95), an economist and publicist.

**Noailles**, **ANNA COMTESSE DE** (1876-1933). French poet. Daughter of Prince Bibesco, she was born in Paris, Nov. 15, 1876, and in 1897 married a grandson of Jules, duc de Noailles. Her first volume of verse, *La Coeur Innombrable*, 1901, made an immediate impression, chiefly on account of its pagan voluptuousness. One of the greatest French poets of her time she excelled in passionate love poetry and in nature-poems notable for exotic intensity. Her best-known works included *L'Ombre des Jours*, 1902; *Les Vivants et les Morts*, 1913; *Les Forces Éternelles*, 1920; *Le Livre de ma Vie*, 1932. She died in Paris, April 30, 1933.

**Nobel**, **ALFRED BERNHARD** (1833-96). Swedish chemist. Born at Stockholm, Oct. 21, 1833, and educated in St.

Petersburg and in the U.S.A., he assisted his father, an inventor of considerable ability. During 1859-61 they devoted themselves to the study of explosives (*q.v.*), perfecting the manufacture of nitroglycerine. The improved explosive was called pyroglycerine, then glonoin oil, and later Nobel's blasting oil. The inconvenience of a liquid explosive led Nobel, in 1866, to mix the liquid with absorbent earth, forming dynamite. He settled in Paris in 1873, and shortly after this time he invented a still more powerful explosive, nitrogelatin or gelnignite. He died Dec. 10, 1896. A biography by H. Pauli appeared in 1948. See Nobel Prize.

Alfred B. Nobel, Swedish chemist

# NOBEL PRIZE: LIST OF AWARDS FROM ITS FOUNDATION, IN 1901, TO 1939

Details of the lives and work of most of the Nobel prizewinners will be found under their own names throughout this Encyclopedia. Any later awards, announced after the completion of this edition of the Encyclopedia, will be included under the heading Nobel Prize in the Novissima Verba section at the end of the final volume

Year	Physics	Chemistry	Medicine	Literature	Peace
1901	W. K. Röntgen (Ger.)	J. H. van't Hoff (Du.)	E. A. von Behring (Ger.)	R. F. A. Sully-Prudhomme (Fr.)	H. Dunant (Swiss)

**Nobel Prize.** Series of five prizes which may be awarded annually to men and women who have contributed to the development of (1) physics, (2) chemistry, (3) medicine or physiology, (4) literature of an idealistic tendency, (5) the cause of peace. The prizes, sums of money which vary slightly from year to year but have each an average value of £8,000, are awarded from the income of a trust fund of £1,750,000 established by the will of Alfred Nobel (*q.v.*). The fund is administered by the Nobel Institute, Stockholm, the board consisting of 15 members appointed by the awarding authorities and a chairman named by the Swedish govt. Awarding authorities are the Swedish academy of science, the Stockholm faculty of medicine, the Swedish academy of literature, and a govt. committee for the peace prize.

Awards are not necessarily made to individuals, but may be given to organizations. Marie Curie, who shared with her husband the physics prize in 1903 and received that for chemistry in 1911, is the only individual awarded two prizes. First awards were made in 1901. Under the Nazi régime, German recipients were not permitted to accept the awards. The accompanying table lists all Nobel prize-winners from 1901 until 1949.

**Nobile, UMBERTO** (b. 1885). Italian airman and aeronautical engineer. Born at Lauro, Avellino, Jan. 21, 1885, he constructed dirigible airships of the semi-rigid type for the Italian government, and was director of the military airship factory at Rome from 1919 to 1929. He designed and commanded the dirigible Norge which flew from Rome to Alaska via the North Pole in the Amundsen-Ellsworth-Nobile expedition of 1926. For his part in this achievement he was promoted general. In 1928 he led an Italian expedition to the North Pole in the dirigible

Italia, but had to land; a sensational rescue was carried out by the Russian ice-breaker Krassin. In 1929 a court of inquiry held him responsible for the accident, and he resigned his post to become professor at the Naples engineering school. He was appointed deputy-chief of Soviet Russian airship construction, 1932, by permission of the Italian government; but in 1936 he was recalled. In 1939 he went to America, where he became head of the engineering department of a school of aeronautics. He wrote several books on his polar flights.

**Nobility** (Lat. *nobilis*, from *noscere*, to know). Literally, the state of being noble. In a narrower sense it suggests belonging to an old and noted family, and is used for the peers and their relatives as a body. See *Peerage*.

**Noble.** Term used for one who is regarded as of superior birth. It is of Roman origin, and is also found among Teutonic peoples, where the word *adel*, or *ethel*, may be translated noble. Some held the belief that the nobles were the descendants of the gods. In the class distinctions that were accentuated by the feudal system, the nobles formed a separate class in most European countries, becoming one of the estates of the realm where these arose. In England they formed the house of lords. Today a noble simply means a peer, and includes sometimes the relatives.

**Noble.** Obsolete English gold coin, first struck by Edward III.

Noble. Obverse and reverse of gold coin of Edward III. Actual size,  $1\frac{1}{2}$  in. diameter

Its original value was 6s. 8d. It was also coined as  $\frac{1}{2}$ - and  $\frac{1}{4}$ -nobles.

**Noble, SIR ANDREW** (1832-1915). A British physicist. Born at Greenock, Sept. 15, 1832, he entered the Royal Artillery, 1849, became secretary to the committee on rifled cannon, 1858, to that on plates and guns, 1859, and a member of a number of other committees on explosives and ordnance. In 1860 he joined Sir W. G. Armstrong, and began a scientific investigation into the effects of various powders. His investigations had a revolutionary effect on the construction of big guns.

He devised the Noble pressure gauge for estimating the pressure developed in the chamber of a gun by the propellant charge. He also invented the chronoscope, an instrument for measuring minute intervals of time. In 1880 he received the gold medal of the Royal Society. Made K.C.B. 1893, and bart. 1902, he died Oct. 22, 1915.

**Noce Dam.** Dam across the Noce river in the Italian province of Trento. Begun in 1939, the barrage is 460 ft. long and creates a lake 5 m. long. The overflow drives turbines generating 250 million kW. annually.

**Nocera Inferiore** OR DE PAGANI. City of Italy, in the prov. of Salerno. It stands on the Sarno, 23 m. by rly. S.E. of Naples. The city has a ruined castle. Pop. 20,000.

**Noctiluca** (Lat. *nox*, night; *lucere*, to shine). Genus of marine flagellate infusorians. They are circular, about 1-50th of an in. in diameter, and have a whip-like process by means of which they swim. They are luminescent, and occur in vast swarms in the British seas.

**Nocturn.** In the R.C. breviary, office appointed to be recited during the night, forming part of the office of matins. The nocturns probably represent a division of the vigils, originally recited at midnight, into two offices on ordinary days and three on Sundays. They consist mainly of psalms and lessons. See *Matins*.

NOBEL PRIZE: LIST OF AWARDS FROM 1943 (NONE MADE 1940-42)

Year	Physics	Chemistry	Medicine	Literature	Peace
1943	O. Stern (U.S.)	G. Hevesy (Hung.)	H. Dam (Dan.) E. A. Doisy (U.S.) J. Erlanger (U.S.) H. S. Gasser (U.S.) Sir A. Fleming (G.B.) Sir H. W. Florey (G.B.) O. B. Chain (Ger.) H. J. Muller (U.S.)	No award	No award
1944	I. I. Rabi (U.S.)	O. Hahn (Ger.)		J. V. Jensen (Dan.)	International Red Cross
1945	W. Pauli (Aust.)	A. Virtanen (Fin.)		G. Mistral (Chile)	C. Hull (U.S.)
1946	P. W. Bridgman (U.S.)	J. B. Sumner (U.S.) W. M. Stanley (U.S.) J. H. Northrop (U.S.) Sir R. Robinson (G.B.)		H. Hesse (Swiss)	E. G. Balch (U.S.) J. R. Mott (U.S.)
1947	Sir E. Appleton (G.B.)		Prof. and Mrs. C. F. Cori (U.S.) B. Houssay (Arg.) P. Muller (Swiss)	A. Gide (Fr.)	Society of Friends
1948	P. M. S. Blackett (G.B.)	A. Tiselius (Swed.)		T. S. Eliot (G.B.)	No award
1949	H. Yukawa (Jap.)	W. F. Glauque (U.S.)	W. R. Hess (Swiss) A. Moniz (Port.)	No award	Lord Boyd-Orr (G.B.)

**Nocturne** (Ital. *notturno*). A musical composition, usually of a placid character. Some nocturnes are of the nature of serenades, others are rather music to accompany sleep scenes, such as Mendelssohn's *Notturno* in the music to *A Midsummer Night's Dream*. John Field (1782-1837) probably first used the title for his short, romantic pianoforte pieces, and Chopin adopted it for more famous ones. Whistler adopted the name to describe certain of his paintings representing twilight or night impressions e.g. *Nocturne, blue and gold—Battersea Bridge*.

**Noddy** (*Anous solidus*). Small tern found in the tropics. It is blackish in colour, with a light patch on the forehead, and distinguished by its graduated tail and the shortness of the middle toe. It breeds in vast colonies off the coasts of Florida and S. America, the nest being a bracket of seaweed projecting from the rocks, one nest serving for hundreds of years.

**Node**. In astronomy, one of the two points in which the orbit of a planet or a moon intersects the ecliptic. The one at which the body passes to the N. of the ecliptic is termed the ascending, the other the descending node. The celestial longitude of the ascending node is one of the astronomical elements which determine the orbit of a planet. The nodes of the planets, on account of planetary perturbations, move slowly round the ecliptic backwards, the period for Mercury, for example, being 166,000 years.

A node in acoustics is the point, line, or surface of an interference pattern at which the amplitude of the sound pressure or particle-velocity is zero. Hence the use of distinguishing terms pressure node and velocity node. As complete interference seldom takes place in practice, the term node is generally associated with minimum rather than zero amplitude.

**Noel-Baker, PHILIP J.** (b. 1889). British politician. Educated at Bootham school, York, in America, and at King's, Cambridge (where he won a running Blue), in 1914 he became vice-principal of Mansfield College, Oxford. He served in ambulance units during the First Great War, and was on the League of Nations secretariat until 1922. Cassel professor of international relations at London university, 1924-29, he was an authority on disarmament. Labour M.P. for Coventry, 1929-31, he was parliamentary private secretary to the foreign minister.

He sat for Derby, 1936-50, then for S. Derby. In 1942 he became parliamentary private secretary to the minister of war transport, and in the Labour administration from 1945 was successively minister of state, secretary for air, secretary for commonwealth relations, and minister of fuel and power. He wrote *The Juridical Status of the British Dominions in International Law*, 1929.

**Nogent-sur-Marne.** Town of France, virtually a residential suburb of Paris. In the dept. of Seine, it is 6 m. E. from the city proper, being close to the Bois de Vincennes. It stands on a hill above the Marne, and rlys. and buses connect it with the capital. It has a Gothic church, and a monument to Watteau, who died here. The industries include chemical factories and pottery works. Pop. 21,547. **Nogent-sur-Seine**, 35 m. N.W. of Troyes, in Aube dept., has a notable church, S. Laurent.

**Nogués, AUGUSTE** (b. 1876). French soldier. Born in Hautes-Pyrénées department, he was trained at St. Cyr. He served in the First Great War and the Riff campaign of 1924-26. From 1936 he was resident-general of Morocco and at the outbreak of the Second Great War assumed command of all French forces in N. Africa. He adhered to the Vichy régime, but in Oct., 1940, warned Germany, Italy, and Spain that French N. Africa would not surrender to any invading force. Having offered resistance to the Allied landings in 1942, he later compromised with Gen. de Gaulle and became a member of the French imperial council. He resigned June 5, 1943, and went to Portugal. In 1947 he was sentenced in his absence to 20 years' imprisonment and loss of civil rights.

**Noise.** Any disorganised sound, as distinct from the organised sounds of music. Advance of mechanised civilization has been accompanied by a crescendo of noises, many of which have become public nuisances, and certain types of noises are now controlled by legislation; e.g. motor cycle exhausts, and the unnecessary sounding of motor horns. The Noise Abatement League has obtained compulsory control of the noise emitted from other machines and processes.

Sound "intensity" is measured in bels and decibels, which represent the amount of physical energy in the sound waves. They are based on a logarithmic scale, so that if the energy is increased ten-

fold the intensity is said to increase by one bel. Zero is fixed at a level (barely audible) where the acoustical pressure is 0.0002 dynes per sq. cm. All sounds of the same intensity do not seem equally loud to the ear; "loudness" is therefore measured by comparison with a pure tone (1,000 c/s) which can be varied in intensity till it matches. The units are phons (*q.v.*). The loudest everyday noise is emitted by an aeroplane propeller; next come a boiler factory, a riveting machine, and, fourth, a clap of thunder. The explosion of Krakatoa in 1883 is said to be the loudest noise ever heard.

**Nola.** City of Italy, in the prov. of Naples. Situated 21 m. E.N.E. of Naples, on the rly. to Baiano, it has a Gothic cathedral and remains of the 4th century church of S. Felix. Built on the site of a city founded probably by Ausonians or Etruscans, it was taken by Rome in 313 B.C. The emperor Augustus died here. Pop. 17,000.

**Nollekens, JOSEPH** (1737-1823). British sculptor. Born in Soho, Aug. 11, 1737, the son of Joseph Francis Nollekens, a landscape painter, called Old Nollekens, he studied at Shipley's school and under Scheemakers. After ten years in Rome, 1760-70, he settled in London, and was elected A.R.A. in 1771 and R.A. in 1772. His works included portrait busts of George III, Wellington, William Pitt, and many other celebrities. He died in London, April 23, 1823. His eccentric appearance and character are described in J. T. Smith's *Nollekens and his Times*, new ed. 1949.

**Nomad** (Gr. *nomades*, pastoral rangers). Term denoting peoples who range from place to place in quest of sustenance. They may hunt afoot, like the Australian aborigines and the Bushmen, or on horseback, like the pampas Indians, or they may be quasi-industrial van-dwellers, like gipsies. The term, however, denotes specifically pastoral tent-dwellers, whose economic life and culture were developed on Eurasian steppes and African grasslands along the margins of cultivable lands or deserts. See *Beduins*; *Ethnology*; *Kirghiz*.

**No Man's Land.** Term applied to a piece of unused or unowned land. A plot of waste land outside London Wall where executions took place was so designated in the 14th century. In the 18th century the term was used for a space for storing ropes, blocks, etc., on ships. In the First Great War it was used for the terrain between

the front-line trenches of the opposing forces.

**Nome** (Gr. *nomos*, district). Territorial division in ancient Egypt. In the XIIth dynasty there were 20 in Lower Egypt and 22 in Upper Egypt and 13 in the Sudan. There were probably 100 under the new empire, and 60 in Roman times. Each had its civil capital, the residence of the hereditary nomarch (*heg*), and the seat of the patron deity. Nome is also, in modern Greece, the name for a province. *See* Egypt.

**Nome.** City of Alaska, U.S.A., on Seward Peninsula. It stands on the N. shore of Norton Sound, and gold was first worked here in 1899. The pop. increased to 20,000 in the following years, when the gold yield of the region rapidly rose. Later it declined, and by 1939 the pop. had sunk to 1,559.

**Nominalism** (Lat. *nomen*, name). A term in scholastic philosophy, opposed to realism. It was first introduced by Roscellinus at the end of the 11th century. Its upholders asserted that genera and species, the universal notions, had no real existence, being merely sounds and words, products of abstraction; the individual alone has a real existence. Long before, Antisthenes the Cynic had declared that he could see a horse, but not horseness (the concept of horse). Realism won the day, but in the 14th century Occam again brought nominalism into favour. Abelard's conceptualism was a kind of middle term between nominalism and realism. *See* Philosophy; Realism.

**Nominative** (Lat. *nominare*, to name). In inflexional languages, the name given to the case indicating the subject or attribute. In the Indo-European group the ending of the nominative singular masculine and feminine was -s (*equus*, *vis*) or the simple stem (*pater*, *musa*); of the neuter -m, or the simple stem (*iugum*, *mare*); in the plural *os* (*es*), *oi* (*i*), *ai* (*ae*) for masculine and feminine (*patres*, *oves*, *vici* for *vici*, *musae* for *musae*). It is probable that the nominative suffix is in its origin pronominal. The nominative is known as *casus rectus*, the upright, independent case, which is in no way subordinate to the other elements of the sentence.

**Non-belligerency.** Term used to describe an attitude of friendly neutrality adopted by a country which, while not taking an active part in hostilities between other countries, gives moral support to the side with which she has racial or political affinities. Non-belliger-

ency does not infringe international law, since a neutral is entitled to sympathise with a belligerent, provided she does not commit acts contrary to her duty of impartiality. Until she attacked France in 1940, Italy adopted non-belligerency in favour of Germany in the Second Great War. *See* Neutrality.

**Non-combatant.** Term for those who, in time of war, are not treated as fighting men, either by their own people or by the enemy. In land and sea warfare it is still possible to maintain some distinction. Non-combatants, who include certain members of the forces, e.g. chaplains, doctors, and clinical workers, as well as civilians, may not, according to international law, be directly attacked, although those attached to the armed forces are liable to injury from any general attack. Hague air warfare rules were drawn up in 1923, but never became binding, as they were not ratified. These prohibited bombing for the purpose of terrorising civilians or of injuring non-combatants.

**Non-commissioned Officer.** Soldier, marine, airman, or member of the Women's Royal Army Corps or Women's Royal Air Force of rank above private and below warrant officer. The four principal non-commissioned ranks in the British Army, Women's Royal Army Corps, and Royal Marines are lance-corporal, corporal, sergeant, and staff sergeant. In the artillery the lance-corporal is called a lance-bombardier and the corporal a bombardier. The three non-commissioned ranks in the R.A.F. and W.R.A.F. are corporal, sergeant, and flight sergeant. All non-commissioned ranks are described separately in this Encyclopedia. N.C.O.s in the Royal Navy are called petty officers.

**Nonconformity.** Name for a religious movement in opposition to, or in independence of, an established Church. Such a movement can, of course, occur only in countries where an established Church exists, and in general speech the word is confined to England.

The publication of the first prayer book of Edward VI, and the Act of Uniformity which required its use in all churches offended the Puritan party in the Church of England and forced them to a statement of their position which was virtually identical with that of a free church in a free state. Under Elizabeth two parties came into being: the Presbyterians, led by Cartwright, who rejected episcopacy but retained

their belief in the establishment; and the Separatists, led by Robert Browne (*g.v.*), who advocated the setting up of independent and autonomous churches. Supporters of both sections were regarded by the law as dissenters and subjected to pains and penalties. A compromise suggested by the Puritans at the Hampton Court conference, 1604, being rejected, the cleavage between the establishment and both the Puritans and Separatists became more pronounced. It was further accentuated by the policy of Archbishop Laud, who insisted on the divine right and apostolic succession of the episcopate. This drove together in a common interest the various types of nonconforming Christians. The religious intolerance of Charles I was one of the chief causes of the Civil War, which was an uprising as much against prelatry in the church as against despotism in the state. The first period of the war saw the triumph of Presbyterianism, through the Westminster Assembly and the Long Parliament. But the country was never Presbyterian at heart, and the Independents stood out against the attempt to make it so.

Charles II undertook to maintain religious toleration, but failed to keep his promise. The Act of Uniformity, which required of all ministers an unfeigned assent and consent to the book of common prayer, was intended to drive the Puritans out of the church. In this it succeeded, some 2,000 ministers being ejected. Dissenting chapels were instituted all over the country, but the Conventicle Act of 1664 made it a penal offence to attend their services, and the Five Mile Act prohibited their ministers from exercising their vocation within five miles of any corporate town, also from keeping schools. Yet Nonconformity, holding its meetings in secret, so continued to flourish that by 1672 Charles had to admit the failure of persecution.

The Toleration Act of 1689 did not repeal previous legislation against Nonconformists, but did away with the penalties of disobedience. Under it, 82,418 licences for meeting-houses were taken out in the next ten years.

The 18th century saw Nonconformity engaged in a struggle for existence, suffering repeated hostile measures, but gradually escaping some of its disabilities. The Occasional Conformity Act, 1711, effectively excluded Nonconformists from the country's public life, and the Schism Act, 1714, from all

opportunities of higher education ; but both were repealed in 1719. Under the house of Hanover a more tolerant spirit prevailed.

The 19th century witnessed a gradual but sure process of emancipation. The Conventicle Act, the Five Mile Act, and others were repealed in the first quarter of the century (though the original Act of Uniformity still remains). At the same time began a campaign for the disestablishment of the church, successful so far as Ireland (1869) and Wales (1920) were concerned. From 1871 Nonconformists were once again admitted to the ancient seats of learning. A further advance was marked by the founding of the Free Church Council (*q.v.*) in 1892, and by the tendency since that time to speak of the Nonconformist bodies as a whole more accurately as the Free Churches. See Baptists; Congregationalism; Disestablishment; Methodism; Society of Friends, etc.

**Nones** (Lat. *nonus*, ninth). The fifth day of the month in the Roman calendar, but in March, May, July, and Oct. the seventh day. See Calendar; Calends; Canonical Hours.

**Nonesuch Press.** British publishing firm founded 1923 by (Sir) Francis Meynell, who remained director of publications after the amalgamation of the organization with Desmond Harmsworth in 1932. It specialized in limited editions of classics designed to use mechanical means of book printing, illustration, and production to the best advantage. The Nonesuch Shakespeare, edited by Herbert Farjeon, was outstanding among its many notable productions.

**Non-Intervention.** Term used to describe the official policy of European powers in the Spanish civil war of 1936-39. They agreed not to supply arms or to send troops to either of the contending Spanish parties, and a non-intervention committee was set up in London to enforce the agreement. International control officers at ports and frontier posts examined men and goods in transit, while a naval patrol operated along the Spanish coasts. Nevertheless large quantities of war material and thousands of trained men infiltrated into Spain to assist one side or the other. The principal offenders were Russia, supporting the republicans, and Italy and Germany, who eventually made possible Gen. Franco's victory. The non-intervention committee ceased to function before the end of the war. See Spanish Civil War.

**Nonjurors.** Name given to a number of clergymen of the Church of England who refused to take the oath of allegiance to William and Mary in 1689. Their contention was that they had already taken the oath to James II and could not transfer their allegiance to another sovereign at the bidding of parliament. In 1690 they were deprived of their livings.

The nonjurors included William Sancroft, archbishop of Canterbury, Thomas Ken, and several bishops, as well as the scholars William Sherlock and Jeremy Collier. Later they were joined by William Law. There were also a few laymen, Henry Dodwell and Henry Hyde, earl of Clarendon, among them. Altogether they numbered about 400. When deprived they held services of their own, and kept up an episcopal succession, but gradually died out. See Divine Right; Jacobites.

**Nonpareil** (*Passerina ciris*). Cage bird, also known as the painted bunting. It is a summer migrant of the S. United States, which winters in Central America. The hen is green above and yellow below, but two-year-old cocks have the head, neck, and upper part of the wings a bright blue, a yellow back shading into green behind, whilst the underparts and the rump are bright scarlet.

**Nonpareil.** Name of printing type. Half the size of pica, it is one size smaller than minion, and one size larger than pearl or agate, and is also called 6-point. Twelve lines make an inch.

**Nonsuch.** Name given by Henry VIII to a palace which he built between Cheam and Ewell, Surrey. Begun in 1538 and nearly completed in 1547, it was sold by Mary to the earl of Arundel, who finished it, but Elizabeth bought

it back and in her time and that of the first three Stuarts it was a royal residence. Charles II gave it to the duchess of Cleveland, who sold it, and it was pulled down about 1680. Nothing of the palace remains.

On Old London Bridge was a remarkable structure called Nonsuch or Nonesuch House. It stood on the 7th and 8th arches from the Southwark end, was constructed entirely of wood, and is said to have been brought over from Holland piece by piece, and to have been put together by dovetailing and pegs without the use of a single metal nail. Built about 1580, it was taken down about 1757. See London Bridge.

**Noodles** (Fr. *nouilles*). Rich form of macaroni made of flour, eggs, and butter, rolled thin, and, three or four layers being superimposed, cut very fine and separated.

**Noon.** Twelve o'clock, the time at which the sun reaches its maximum altitude during the day. Two kinds may be distinguished: apparent noon occurs when the true sun crosses the observer's meridian; mean noon is similarly related to the fictitious mean sun (see Equation of Time). They are respectively the noons given by a sundial and by a clock, and may differ by as much as 16 mins. Civil or legal noon will differ from local noon at a place as the latter's longitude differs from that of the standard meridian. Thus local mean noon in Cornwall occurs at about 12.20 p.m. G.M.T.

**Noon, (Sir) FIROZKHAN** (b. 1893). Indian lawyer and politician. Born at Lahore May 7, 1893, he was educated at Chiefs College there and Wadham College, Oxford. Advocate of the Lahore high court from 1917, in 1920 he was

Nonsuch. The Surrey palace built by Henry VIII. From a print of 1582

elected to the Punjab legislative council, and in 1927 became minister for local self-government in the prov., and minister for education, 1931-36. He was high commissioner for India in the U.K., 1936-41, defence member of the viceroy's executive council for India, 1942-45, Indian representative in the British war cabinet, 1944-45, and Indian delegate to the San Francisco conference (*q.v.*). In Sept., 1945, he resigned his post as defence member to return to politics as a member of the Muslim League (*q.v.*). Sir Firoz Khan, who had been knighted in 1933, renounced his titles and honours in 1946 as a protest when it seemed possible that Pakistan would not be created on the transfer of power in India. He became gov. of E. Bengal, 1950. He published *Canada and India*, 1939; *Wisdom from Fools*, 1940; *Scented Dust*, 1941.

**Nootka.** Group of American Indian tribes on the W. coast of Vancouver Island, British Columbia. Numbering a few hundreds, they form—with the Kwakiutl—the Wakashan stock, and are allied to the Makah of the adjacent Washington coast. Their rectangular timber houses are decorated with paintings of fantastic human and animal figures.

**Nootka Sound.** Fjord on the W. coast of Vancouver Island, British Columbia. It is 6 m. wide, with a minimum depth of 250 ft. Three arms stretch inland, 7, 14, and 18 m. respectively. Nootka Island lies W. of the sound, with Esperanza Inlet N. of it. Nootka settlement is on the S. point.

This settlement was founded in the 18th century by some English merchants, who traded with China. In 1789-90, three of their ships were seized by some Spaniards. The British government asked for redress, to which Spain replied by claiming Nootka for herself. Both countries and their allies prepared for war, but the French national assembly was against it, and negotiations were begun. On Oct. 28, 1790, a treaty was signed by which Spain surrendered all her claims.

**Nō Plays.** Japanese dramatic entertainment. One of the oldest and most elementary forms of Japanese drama, these plays rely much on the visual aids of pantomimic gesture and traditional costume. As originally conceived, they were short lyrical episodes, staged by small private companies travelling from house to house. The characters seldom exceeded five, and the scenery, though highly decorative, was reduced to a minimum. Later

the cast was augmented by a chorus, orchestra, and dancers. There are 250 plays in the repertory of the Nō drama, divided into five classes: (1) the *waki-nō*, dealing with Buddhist deities; (2) the *shura-nō*, with the ghosts of departed warriors; (3) the *kazura-nō*, noble ladies portraying the chief characters; (4) the *genzai-nō*, or modern drama of human appeal; (5) drama of demons and goblins. Okina, the sun-goddess, always appears in the prologue.

**Norbiton.** District in the bor. of Kingston-upon-Thames, Surrey, England. It has a rly. station 12 m. S.W. of London. S. Peter's is the chief church. Pop. 13,620.

**Norbury.** Residential district of the bor. of Croydon, Surrey, England. It is 7 m. S. of London, and connected with the metropolis by rly., tram, and bus. Here are the links of North Surrey golf club. Pop. 15,538.

There is a Norbury in Derbyshire, 7 m. N.N.E. of Uttoxeter, on the Staffs border, with a rly. station. It has an old church, S. Mary's, partly of the 14th century, with monuments to the Fitzherberts—remains of whose 14th century hall are seen—and is supposed to be the Norbourne of George Eliot's Adam Bede. Pop. 354.

Norbury Park, with the Druid's Grove, is near Box Hill, Surrey.

**Nord.** Dept. of France. The frontier prov. between France and Belgium, it runs S.E. from the English Channel to the Ardennes, and is divided into two parts connected by a wedge of land 5 m. wide. It has an area of 2,228 sq. m., and is watered by the Schelde, Scarpe, Lys, and Sambre. The chief cities and towns, nearly all known for manufactures, are Dunkirk, Hazebrouck, Lille (the capital), Douai, Valenciennes, Roubaix, and Cambrai. Its minerals include coal, iron, lead, and bitumen. In the S. half took place some of the fiercest fighting during 1914-18, and the B.E.F. fought here in 1940. Pop. 1,917,452. See Canal du Nord.

**Nordau,** MAX SIMON (1849-1923). German-Hungarian author.

A Jew by family, his real name Sudfeld, he was born at Budapest, July 29, 1849, studied medicine, travelled widely, and having settled in Paris, practised from 1880 as a physician. Nordau's nov-

els and dramas were written to illustrate his social theories; among the novels being *The Drones Must Die*, 1893, and among the dramas, *The Right to Love*, 1894, and *Morganatic*, 1904. He is better known by analytical studies of contemporary society, *The Conventional Lies of Civilization*, 1884; *Paradoxes*, 1885, 1886; *The Malady of the Century*, 1887; *Degeneration*, 1892. The works named have been rendered into English. Nordau died Jan. 22, 1923.

**Nordenskiöld,** NILS ADOLF ERIK, BARON (1832-1901). Finnish explorer. Born Nov. 18, 1832, and educated at the University of Helsinki, he studied mineralogy and mining. He moved to Stockholm in 1857, and made valuable geological discoveries in Spitsbergen. For a time director of the royal museum at Stockholm, in 1861 and 1864 he made further expeditions there, and in 1868 he made a polar expedition, reaching 81° 42' N. He accomplished the N.E. passage in the Vega in 1878-80. He died Aug. 12, 1901. His works in English include *The Voyage of the Vega around Asia*, 1881; *The Second Swedish Expedition to Greenland*, 1885.

N. A. Nordenskiöld, Finnish explorer

His nephew, Nils Otto Gustaf Nordenskiöld (1869-1928), made a scientific exploration of the Magellan Straits and Patagonia, 1895-97, and of Alaska, 1898, and commanded the Swedish expedition of 1901-04 which discovered Oscar II Land.

**Nordenskiöld Sea.** Section of the Arctic Ocean, N. of Siberia, between the Taimyr peninsula and the New Siberia islands. It receives the waters of the Lena, Olenek, and Khatanga rivers, and was named after Nils Nordenskiöld, who navigated it in 1878.

**Norderney.** Island of W. Germany, one of the Frisian group. It is about 8 m. long and 1 m. wide, and is in the *Land of Lower Saxony*. It was used by the Germans as a seaplane base in the Second Great War and repeatedly bombed by the R.A.F. Norderney was occupied by the R.N. in May, 1945. Pop. (1950) 7,200. See Frisian Islands.

**Norddeutscher Lloyd.** German shipping company, one of the greatest in the world. Founded in

Max Nordau, German-Hungarian author

1857 at Bremen, it ran next year the first service from Germany to New York, with four steamers, won the blue riband in 1884, and started lines to S. America in 1875 and the Far East and Australia in 1886. By 1914 it had 117 ships with 710,000 tons. These were mostly lost in the First Great War or by confiscation for reparations. Reconstruction produced by 1930 187 vessels with 905,000 tons, including the Bremen and Europa. That year a 5 years' alliance was concluded with the Hamburg-America line, founded 1847. Seaworthy units were confiscated by the Allies after the Second Great War. See Bremen; Europa.

**Nordhausen.** Town of E. Germany in the *Land* of Saxony-Anhalt. It is situated in the fertile plain of the Goldene Aue. At one time a residence of the Emperors, it was a free city from 1253 to 1803, when it was absorbed into Prussia. It had remnants of the ancient fortifications. Industries have included engineering, chemical, tobacco, and textile manufactures. It also gave its name to Nordhausen, or fuming, sulphuric acid. During the Second Great War it was the site of a concentration camp. Captured April 11th, 1945, by the U.S. 1st army, after the war it was included in the Russian occupation zone. Pop. (pre-war), 37,000.

**Nordic.** Term used in a geographical and anthropological sense to describe the countries, people, and customs of the Scandinavian states of Sweden, Norway, Denmark, and Iceland. Nordics are fair and blue-eyed, and distinguished by their height and long heads; they are believed to have originally come from S. Russia. There is no Nordic race, but only a Nordic type, which makes up 70 p.c. of the Scandinavian population, 20 p.c. of Germans, Dutch, and British, and ten p.c. of the people of the U.S.A. The term Nordic is best known from a theory, developed in Germany, which became part of Hitler's philosophy.

The French Count Joseph de Gobineau (1816-1882) first propounded the fable of a Nordic race with superior courage and exceptional intellect. His theory was developed by the Germanised Englishman Houston Chamberlain and supported by Carlyle and Madison Grant. The Nordic race was supposed to have periodically come down into W. Europe from the N., and to have remained superior to the S. peoples in

courage, intelligence, and progressive thought.

In Germany the Nordic theory was enthusiastically supported; many Germans claimed that they themselves were Europe's purest Nordics. All great men in history, science, and art were considered to be Nordics. The civilization of ancient Greece was attributed to blond Nordics who conquered the country about 2,000 B.C., and the Indian, N. African, and Inca civilizations to the voyages of the Nordic Vikings.

Under Hitler the Nordic theory was carried to extreme lengths, and the Nazi faith claimed that it was the mission of German Nordics to govern other peoples. It became part of Nazi policy to select only Nordic types for official positions, and to encourage the breeding of Nordics by a system of marriage control among party members.

**Nordland.** Fylke or co. of Norway. It stretches for over 300 m., and has a breadth of less than 60 m. It includes in the N. the Lofoten Islands (*q.v.*), and the coast is fringed by islets, of which the chief group is the Vikten Islands in the S. The chief town is Bodø, on Salt Fjord. Area is 14,727 sq. m. Pop. 214,900.

**Nördlingen.** Town of Bavaria, Germany. It stands on the Eger, at a height of 1400 ft. 38 m. N.N.W. of Augsburg and 70 m. from Munich, and is an important rly. junction. It is one of the few remaining medieval towns, the walls of the ancient town still standing. Notable buildings include S. Saviour's church (1422), and a Gothic town hall (14th cent.).

Frederick II made it a free city of the Empire c. 1220, and during the 14th and 15th century it flourished as a member of the Saubian federation. During the Thirty Years' War it was the scene of two battles. In the first, 1634, the Swedish army, with its German auxiliaries, was routed by the Imperialists, and in the second, 1645, the French army of Turenne defeated the Imperialists. Nördlingen declined in importance and was incorporated in Bavaria. After May, 1945, it was in the U.S. occupation zone. Pop. est. 10,000.

**Nordstrand.** Island of Germany. It lies off the W. coast of Schleswig-Holstein, W. of Husum, with which it has steamer connexion. Its area is 20 sq. m.

**Nord-Trøndelag.** Fylke or co. of Norway. It is centrally situated, with a small section of the Atlantic coast near the Vikten Islands.

Trondhjem Fjord extends almost half-way across the co. from the S.W.; Folden and Nansen Fjords are large indentations in the N.W. The rly. from Trondhjem reaches Stenkjaer. The chief town is Levanger. The area is 8,659 sq. m. Pop. 104,626.

**Nore, THE.** Sandbank in the Thames estuary, England. It is about 3 m. N.E. of Sheerness and 47 m. E. of London. At the E. extremity is the Nore lightship, anchored here since 1732. The Nore is generally regarded as marking the mouth of the Thames, and is an important anchorage. The naval mutiny at the Nore took place May 20 to June 13, 1797.

**Nore.** River of Eire. Rising in the N. of co. Tipperary, it flows 70 m. S.E. through co. Leix and co. Kilkenny to the Barrow, which it enters 2 m. above New Ross. The Nore is tidal to Inistioge, 10 m. from its mouth.

**Norfolk.** Eastern and maritime county of England, the fourth largest in the country. It has about

Norfolk arms

90 m. of coastline on the Wash and the North Sea, and an area of 2,054 sq. m. The surface in the interior is undulating or flat, the latter in the W., where the fen district enters the county, while along much of the coast it is quite low, and suffers in parts from the encroachments of the sea, as it does in the few places where cliffs fringe the shore. Along the Wash, however, some land has been reclaimed. The chief river is the Yare, with its tributaries, Wensum, Bure, and Waveney, which divides Norfolk from Suffolk. The Great Ouse and its tributaries also water the county, which contains the shallow lakes known as the Broads.

Norfolk is a noted agricultural county. Wheat, barley, and oats are largely grown; cattle and sheep are reared; and some land is given up to fruit. In the south of the county the forestry commissioners have planted a large forest. Fishing is an important industry, while oil shales are worked near King's Lynn. Norwich is the county town and the largest place. Other corporate towns are Yarmouth, King's Lynn, and Thetford, smaller places being East Dereham, North Walsham, Downham Market and Wymondham. Cromer, Sheringham, Mundesley, and Hunstanton on the

Norfolk. Map of the maritime county of East Anglia, noted for agricultural produce and cattle-raising

Wash, are watering-places. The county, which is mainly in the diocese of Norwich, elects six M.P.s (and two for Norwich).

Norfolk was part of E. Anglia, and soon after 1066 became one of the richest parts of England; this was due mainly to its sheep farming. Wealth increased when in the 12th century Flemings introduced the worsted manufacture. Woollens were also manufactured, and Norwich became one of the three greatest cities of the kingdom. There are ruins of castles at Castle Acre and Castle Rising. In the county are Sandringham, Houghton, Holkham, Paston, and Nelson's birthplace, Burnham Thorpe.

**LITERARY ASSOCIATIONS.** The Babes in the Wood are supposed to have been left to die in Wayland Wood, between Watton and Wymondham; and The Bailiff's Daughter of Islington belonged to the hamlet of that name near King's Lynn. The Paston Letters, with their intimate revelations of 15th century life, may be recalled at Caister, near Yarmouth, and elsewhere. Dickens placed notable scenes of David Copperfield at Yarmouth. Borrow wrote of Norwich and other Norfolk places in Lavengro. R. H. Mottram, a native, gives a Norwich setting to many of his books. See Broads.

**Bibliography.** Norfolk Broads and Rivers, G. C. Davies, 1884; History of Norfolk, W. Rye, 1885; Bygone Norfolk, W. Andrews, 1898; Victoria History, Norfolk, ed. H. A. Doubleday and W. Page, 1901; Norfolk, R. H. Mottram, 1946.

**Norfolk.** City of Virginia, U.S.A. in Norfolk co. It stands on the Elizabeth river, an arm of Chesapeake Bay, 68 m. S.E. of Richmond, and is served by the Chesapeake and Ohio and other rlys., and by steamship lines. Transport facilities are also provided by two canals. A big port and the second largest city of the state, Norfolk has a spacious harbour. Its U.S. navy yard is one of the two largest American naval bases, occupying 453 acres. The city has many industrial establishments. In 1939 it was beautified by the planting of thousands of azalea trees. Pop. 144,432.

**Norfolk, EARL AND DUKE OF.** English titles, the latter being the senior dukedom in the peerage. After the Conquest of 1066 the earldom of Norfolk was held by several nobles, including members of the family of Bigod. It passed through female descent from the Bigods to the Mowbrays. In 1397 Thomas Mowbray was created duke of Norfolk, and except for a short period his descendants held the title until 1476, when John, the 4th duke, died without sons.

John Mowbray's daughter Anne married Richard, younger son of Edward IV, and for two years that young prince was duke of Norfolk. In 1483 John Howard was created duke of Norfolk by Richard III, and the present title dates from that year. The Howards were descended through a female from Thomas Mowbray, the 1st duke. In 1572 the 4th duke was attainted and the title lapsed until 1660, when Thomas Howard, earl of Arundel, a descendant of the attainted duke, was restored to the dukedom by parliament. Many of the earlier earls and dukes of Norfolk had filled the office of earl marshal, and in 1672 this was made hereditary in the family. Since 1842 the surname Fitzalan has been prefixed to Howard. The principal seat of this leading R.C. family is Arundel Castle, and an eldest son is called earl of Arundel or earl of Surrey. See Arundel; Earl Marshal; Howard.

**Norfolk, JOHN HOWARD, 1ST DUKE OF** (c. 1430-85). English soldier. A kinsman of the Mowbray family, dukes of Norfolk, he fought in the Guienne campaign, 1453, and became knight of the shire for Norfolk, and sheriff under Edward IV, 1461. He fought against the Lancastrians, and though created Baron Howard by Henry VI, 1470, he remained faith-

ful to Edward, whom he accompanied to France, 1475, and acted as diplomatic representative, 1477-80. He was made duke of Norfolk and earl marshal by Richard III, 1483, and was killed at the battle of Bosworth. His title was attained by Henry VII, but a reversal was secured by his son Thomas, earl of Surrey, who became 2nd duke in 1514.

**Norfolk, THOMAS HOWARD, 3RD DUKE OF (1473-1554).** English soldier. Son of Thomas Howard,

Thomas Howard,  
3rd Duke of Norfolk  
After Holbein

2nd duke, he fought at Flodden, 1513, and became earl of Surrey on his father's restoration to the dukedom in 1514. He was lord-lieutenant of Ireland, 1520-21, raided the French coast, became lord treasurer, 1522, and as warden of the marches raised the Scots' siege of Wark Castle, 1523. He cruelly suppressed the Pilgrimage of Grace (*q.v.*), 1537-38, and commanded the English army sent against the Scots in 1542. His influence, however, waned before that of Hertford, and he was imprisoned 1546-53, but released by Mary. His attainder was reversed, and he died at Kenninghall, Norfolk, Aug. 25, 1554. The poet Surrey (*q.v.*) was a son.

**Norfolk, THOMAS HOWARD, 4TH DUKE OF (1536-72).** English politician. Born March 10 1536, son of the poet Surrey, he was taught by John Foxe, and succeeded to the dukedom in 1554. He represented Elizabeth in the Scottish negotiations, 1559-60 and in 1568. For planning

After Holbein

a marriage with Mary Queen of Scots he was imprisoned by Elizabeth, 1569-70. Released on a promise of allegiance and renunciation of the marriage scheme, he was drawn into the Ridolfi plot, arrested in Oct., 1571, and, denying that he was a Roman Catholic, was executed as a traitor, Jan. 2, 1572.

**Norfolk, HENRY FITZALAN-HOWARD, 15TH DUKE OF (1847-1917).** British politician. Born Dec. 27, 1847, son of Henry Granville, 14th duke (1815-60), he was

educated at the Oratory school, Edgbaston. He was envoy for Victoria at the jubilee of Leo XIII,

Henry Fitzalan-  
Howard,

Russell

1887, and was postmaster-general, 1895-1900. Elected mayor of Sheffield in 1895, he was first chancellor of its university, and sat on the L.C.C., 1892-95. Active in all matters pertaining to the R.C. Church in Great Britain, he took part as earl marshal in the coronation ceremonies of Edward VII and George V, was lord-lieutenant of Sussex from 1905, and died Feb. 11, 1917.

**Norfolk, BERNARD MARMA- DUKE FITZALAN-HOWARD, 16TH DUKE OF (b. 1908).** British peer.

Son of the 15th duke, whom he was to succeed in 1917 as earl marshal, hereditary marshal, and chief butler of England, he was born May 30, 1908. As premier duke he played a leading part

Bernard Fitzalan-  
Howard,  
16th Duke of Norfolk

at the coronation of King George VI in 1937. Mayor of Arundel, 1935-36, he was joint parliamentary secretary to the ministry of agriculture, 1941-45. He married in 1937 Lavinia Strutt, daughter of Lord Belper. See Earl Marshal.

**Norfolk Island.** Islet in the Pacific within the territory of the Commonwealth of Australia. It is 5 m. long, 3 m. wide, and covers 13 sq. m. Discovered by Capt. Cook in 1774, it is 400 m. N.W. of New Zealand and 930 m. N.E. of Sydney. The climate is mild, the temperature averaging 68° F. with a range of 35° F.; the rainfall is 55 ins. annually. Bananas, lemons, guavas, pineapples, and passion fruit are grown, coffee is cultivated, and whaling is carried on. In 1856 the descendants of the mutineers of the *Bounty* were removed here from Pitcairn Island. Norfolk I. was handed over to Australia in 1914. Pop. 733.

**Norfolk Regiment, ROYAL.** Regiment of the British army. Raised in Gloucestershire in 1685 by Henry Cornwall, a captain in the Royal Horse Guards, for the suppression of the Monmouth rebellion, it came on to the estab-

lishment as the 9th (East Norfolk) Foot. It first saw active service under Marlborough in 1701. At the battle of Almanza, 1707, it covered the British withdrawal, its gallant conduct earning it the figure of Britannia as the regimental badge. The 9th Foot won its first battle honour, Havannah, in 1762 and added Martinique in 1794. It fought under Wellington in the Peninsula where, its badge being mistaken for a figure of the Virgin Mary, it derived its nickname of "The Holy Boys." The regiment provided the funeral party for Moore at Corunna, a fact commemorated by the black thread twined with the gold lace on full-dress tunics.

Thereafter the regiment served many years in India. It was in the Afghan War of 1842, the Sikh War, served throughout the Crimean War, and having returned to India, marched in 1879 with Roberts from Kabul to Kandahar. Its next active service was in the Burmese War of 1889. In the Boer War as part of the 7th division it was at the victory of Paardeburg. Twenty battalions were raised in the First Great War and earned the honours: Mons; Le Cateau; Marne, 1914; Ypres, 1914, '15, '17, '18; Somme, 1916 '18; Hindenburg Line; Suvla; Gaza; Shaiba; Kut-el-Amara. Moving to France with the B.E.F. in 1939, the Norfolks earned the first decorations awarded for gallantry, in the field in the Second Great War. Of a battalion drafted to Singapore, the survivors were taken prisoner when the island surrendered. Other battalions served in the Burma campaign, winning particular distinction at Kohima in 1944. The regimental depot is at Norwich.

**Norham.** Village of Northumberland, England. It stands on the Tweed, 6 m. S.W. of Berwick-on-Tweed, with a rly. station. Norham castle, one of the strongest defences of the English border, is mentioned in Marmion. Built by a bishop of Durham in the 12th cent., it is now a ruin, the chief feature being the Norman keep. The district around is known as Northamshire.

**Noric Alps (anc. *Alpes Noricae*).** Section of the E. Alps, between the valleys of the Mur and the Drave. The name was formerly applied to the whole area (Styria, Salzburg, Lower Austria, and part of Carinthia) included in the Roman prov. of Noricum. The highest peak is the Eisenhut, alt. 8,000 ft.
